Negative Pressure Pulmonary Edema Following Upper Airway Obstruction Ronald C. Iacone,1995

A Classic Case of Severe Negative Pressure Pulmonary Edema Reagan Myers,2014 Negative pressure pulmonary edema (NPPE) is a form of noncardiogenic pulmonary edema that occurs in approximately 0.1% of patients undergoing general anesthesia and develops in an estimated 12% of patients who develop an upper airway obstruction throughout the perioperative period. Due to potential life threatening complications associated with NPPE it is important for the practitioner to recognize the signs of NPPE as well as when and how to properly treat it. This case study is exemplary of severe NPPE that develops in a young, healthy adolescent male as a result of an upper airway obstruction that occurred during transport to the post anesthesia recovery unit.--authors' abstract.

**Negative Pressure Pulmonary Edema Due To Residual Neuromuscular Blockade** ,2017 Negative pressure pulmonary edema (NPPE) is a well described object but with few reported cases. Its recognition is important to initiate appropriate treatment. Related to the anesthetic act, it may occurs after extubation, due to causes that lead to airflow supraglottic obstruction through inspiratory effort. Reversing the neuromuscular blockade is an important step during the anesthetic procedure, because if it is inadequate, can cause respiratory complications generating intrathoracic negative pressure and resultant alveolar transudation.
