Introducción a la Contaminación Atmosférica Héctor Jorquera González,2018-06-21 Este libro ha surgido con la intención de resumir en un solo volumen una variedad de temas abordados en forma separada por distintas disciplinas, y a la necesidad de tener en español un texto de nivel universitario en esta temática. El enfoque se basa en una aproximación analítica -¡muy ingenieril!- al problema de la contaminación atmosférica, en la forma de una cadena causal que va desde el emisor al receptor, donde cada eslabón se estudia por separado y finalmente se hace la síntesis conectándolos. Esta formulación es, por lo demás, la metodología aceptada de evaluación del problema, desde su origen en las emisiones, hasta el impacto social de la contaminación atmosférica, valorizado de manera monetaria.

Contaminación atmosférica D. J. Spedding, 2021-02-22 Para muchos, química y contaminación tienen la misma significación, hasta el extremo de que al químico se le considera el responsable directo de la polución. Sin duda, después de haber leído este libro el lector habrá cambiado de opinión y cargará a la Naturaleza gran parte de la culpabilidad del hombre

Modelling the Wind Flow and Dispersion of Reactive Pollutants in Cities at Microscale Beatriz Sánchez Sánchez, 2018 Air quality is nowadays a priority environmental concern in the cities. High pollution levels have been often observed in urban areas, where both emissions and population are concentrated. The NO_x, namely NO and NO₂, are the primary traffic-related pollutants in gas-phase, but only the NO₂ is legislated given that it is the harmful to human health. Despite the environmental policies adopted in the recent years, the limit values established by the European Union (EU) and the World Health Organization (WHO) are widely exceeded across Europe, especially in urban areas. Accordingly, exhaustive studies are required to manage and plan mitigation strategies for the abatement of urban air pollution. The complexity of atmospheric processes in urban environments hinders the assessment of air quality in the streets using both monitoring techniques and numerical models. The vast number of obstacles found in an urban area (buildings, vegetation, vehicles...) lead to complex flow patterns in the streets. Additionally, the heterogeneity of pollutant emissions, mainly from road traffic, across the city, gives rise to strong gradients of concentration. Hence the irregular distribution among buildings can only be captured by maps of high spatial resolution. In this sense, the Computational Fluid Dynamics (CFD) models are powerful tools for reproducing the dispersion of pollutants considering realistic features of urban environments...
