Kotlin from Scratch Faisal Islam, 2025-01-14 Learn Kotlin Through 37 Projects Kotlin isn't just for building Android apps. As you'll learn in *Kotlin from Scratch*, it's also a general programming language for crafting both elegant and efficient code. With the aid of 37 hands-on projects, you'll move quickly through the language basics while building your problem-solving skills, even tackling advanced concepts like fractals, dynamic systems, and nature-inspired algorithms. You'll explore the way Kotlin handles variables, control structures, functions, classes, and data structures, and you'll learn to create visualizations using Kotlin and the JavaFX graphics library. Then you'll build increasingly sophisticated apps to practice what you've learned while tackling challenges from math and science to algorithms and optimization. As you progress through the book, you will: Simulate physical systems, like the intricate dance of binary stars Implement the classic Hill cipher for encryption and decryption Generate beautiful fractals with recursive algorithms Program classic computer science algorithms for sorting and searching Solve the infamous Berlin52 traveling salesman problem Expand your language repertoire and improve your computational thinking with Kotlin from Scratch.

The Ray Tracer Challenge Jamis Buck, 2019-02-26 Brace yourself for a fun challenge: build a photorealistic 3D renderer from scratch! It's easier than you think. In just a couple of weeks, build a ray-tracer that renders beautiful scenes with shadows, reflections, brilliant refraction effects, and subjects composed of various graphics primitives: spheres, cubes, cylinders, triangles, and more. With each chapter, implement another piece of the puzzle and move the renderer that much further forward. Do all of this in whichever language and environment you prefer, and do it entirely test-first, so you know it's correct. Recharge yourself with this project's immense potential for personal exploration, experimentation, and discovery. The renderer is a ray tracer, which means it simulates the physics of light by tracing the path of light rays around your scene. Each exciting chapter presents a bite-sized piece of the puzzle, building on earlier chapters and setting the stage for later ones. Requirements are given in plain English, which you translate into tests and code. When the project is complete, look back and realize you've built an entire system test-first! There's no research necessary -- all the necessary formulas and algorithms are presented and illustrated right here. Dive into intriguing topics from fundamental concepts such as vectors and matrices; to the algorithms that simulate the intersection of light rays with spheres, planes, cubes, cylinders, and triangles; to geometric patterns such as checkers and rings. Lighting and shading effects, such as shadows and reflections, make your scenes come to life, and constructive solid geometry (CSG) enables you to combine your graphics primitives in

simple ways to produce complex shapes. Play and experiment as you discover the fun of writing a ray tracer. Accept the challenge today! What You Need: Aside from a computer, operating system, and programming environment, you'll need a way to display PPM image files. On Windows, programs like Photoshop will work, or free programs like IrfanView. On Mac, no special software is needed, as Preview can open PPM files.

Fast Matrix Multiplication with Applications Jerzy S. Respondek, 2025-02-26 The ambition of this monograph is to show the methods of constructing fast matrix multiplication algorithms, and their applications, in an intelligible way, accessible not only to mathematicians. The scope and coverage of the book are comprehensive and constructive, and the analyses and algorithms can be readily applied by readers from various disciplines of science and technology who need modern tools and techniques related to fast matrix multiplication and related problems and techniques. Authors start from commutative algorithms, through exact non-commutative algorithms, partial algorithms to disjoint and arbitrary precision algorithms. Authors explain how to adapt disjoint algorithms to a single matrix multiplication and prove the famous tau-theorem in the (not so) special case. In an appendix, authors show how to work with confluent Vandermonde matrices, since they are used as an auxiliary tool in problems arising in fast matrix multiplication. Importantly, each algorithm is demonstrated by a concrete example of a decent dimensionality to ensure that all the mechanisms of the algorithms are illustrated. Finally, authors give a series of applications of fast matrix multiplication algorithms in linear algebra and other types of problems, including artificial intelligence.

Math Concepts for Food Engineering Richard W. Hartel, D.B. Hyslop, Terry Howell, Jr., 1997-05-19 Food industry managers, engineers, and scientists require a personal repertory of mathematical tools to find solutions to a variety of work problems. These problems relate to processing, research, analysis, and other operations that require mathematical solutions. This new handbook provides a practical review of required basic mathematical methods, and relates them to specific areas of food industry problem solving. Prepared for students in undergraduate food science programs, the handbook also serves the needs of food industry technical personnel who would be helped by a review of basic math for food engineering and non-technical managers who seek an introduction to food engineering math and problem solving. Each chapter on a math or problem-solving skill begins with fundamental concepts, presents step-by-step procedures in the skill, and provides numerous practical, illustrative examples. Practice problems with answers in the appendix provide for self-testing and reinforcement of learning. All of the math skills presented relate to common food industry problems. From the text In food engineering, and any other mathematically oriented discipline, one must become adept at problem solving using equations and mathematical principles. Many of the problems that food scientists and engineers face require the ability to apply physical and mathematical principles to solve equations and calculate necessary information. Thus, problem-solving abilities are extremely important, and we should be familiar with the general steps in problem solving.

Worst-case Timing Analysis of Concurrently Executing DMA I/O and Programs Tai-Yi Huang,University of Illinois at Urbana-Champaign. Department of Computer Science,1996 Abstract: A hard-real-time system is required to process tasks with timing constraints that must be met to ensure the safety and correctness of the system. The analysis which determines the ability of a particular system to meet its timing constraints requires that the worst- case execution time (WCET) of each task be known in advance. The dynamic architectural features such as cache memory and instruction pipeline introduce variations in program execution times. The interference of concurrently executing cycle-stealing DMA I/O operations further complicates the problem of determining the WCET of a program. This dissertation presents methods for bounding the worst-case interference between an executing program and a cycle-stealing DMA I/O operation. We first develop a method for bounding the WCET of a program executing concurrently with cycle-stealing DMA I/O. Our method converts the problem of bounding the WCET to one of solving a [sic] integer linear programming problem. We implement our method in a timing tool and conduct extensive experiments with the timing tool to demonstrate the merits of our method. A cycle-stealing DMA I/O task is allowed to proceed only when the CPU does not need the system bus. As a result, the execution time of a cycle-stealing DMA I/O task is affected by a set of CPU tasks which execute concurrently with the I/O task. We discuss the problem of bounding the WCET of a cycle-stealing DMA I/O task under a workload which consists of a set of independent CPU tasks. Each CPU task has an arbitrary release time. We use the dynamic programming technique to bound the WCET of the I/O task.
