Differential Equations and Boundary Value Problems Charles Henry Edwards, David E. Penney, 2000 For introductory courses in Differential Equations. This text provides the conceptual development and geometric visualization of a modern differential equations course while maintaining the solid foundation of algebraic techniques that are still essential to science and engineering students. It reflects the new excitement in differential equations as the availability of technical computing environments like Maple, Mathematica, and MATLAB reshape the role and applications of the discipline. New technology has motivated a shift in emphasis from traditional, manual methods to both qualitative and computer-based methods that render accessible a wider range of realistic applications. With this in mind, the text augments core skills with conceptual perspectives that students will need for the effective use of differential equations in their subsequent work and study.

Ecuaciones Diferenciales Ana Elizabeth García Hernández, David Piña Reich, 2014-10-21 En sus páginas, Ecuaciones diferenciales aborda con amplitud los temas principales de esta asignatura, la cual forma parte de los programas de estudio de las diferentes ingenierías. Los temas que se estudian y analizan en este texto, sin duda también han enriquecido a otras disciplinas, al mismo tiempo que a otras áreas del conocimiento, convirtiéndola en una disciplina de estudio muy completa. Con este libro, los estudiantes de ingeniería y las diferentes carreras de ciencias tienen la oportunidad de adquirir y desarrollar las habilidades necesarias para poder adaptarse e insertarse con facilidad en un entorno de aprendizaje cambiante y competitivo; en otras palabras, Ecuaciones diferenciales proporciona todos los elementos teóricos y, sobre todo, prácticos necesarios para que puedan aplicar lo aprendido en su vida académica y más tarde en su ámbito profesional.

John E. Freund's Mathematical Statistics John E. Freund, Irwin Miller, Marylees Miller, 1999 For a two-semester or a three-quarter calculus-based Introduction to the Mathematics of Statistics course. This classic, calculus-based introduction to the theory - and application - of statistics provides an unusually comprehensive depth and breadth of coverage and reflects the state-of-the-art in statistical thinking, the teaching of statistics, and current practices - including the use of the computer. *NEW - Places greater emphasis on the use of computers in performing statistical calculations. *NEW - Includes new

exercises - many of which require the use of a computer. *NEW - Expands coverage of Analysis of Variance to include the two-way analysis-of-variance model with interaction and a discussion of multiple comparisons. *NEW - Adds appendices which summarize the properties of the special probability distributions and density functions that appear in the text. *Places greater emphasis on the use of computers in performing statistical calculations. *Comprehensive coverage of statistical theories. *Features more than 1,100 problems and exercises - divided into theory and applications.

Métodos matemáticos. 2ª ed. SAN MARTÍN MORENO, JESÚS, TOMELO PERUCHA, VENANCIO, UÑA JUÁREZ, ISAÍAS, 2015-01-01 Las matemáticas, además de perseguir sus propios fines como ciencia y aportar una creación estética tan considerable, se involucran en el diseño metodológico y en la actuación sistemática de otras disciplinas. El espectacular desarrollo de las ciencias fisiconaturales, biomédicas, económicas y sociológicas, así como el de la ingeniería en todas sus especialidades, sería impensable en nuestros días sin la intromisión cómplice del método matemático. En este contexto de matematización creciente de la actividad científica cobra renovada actualidad la afirmación que Alberto Dou, magnífico formador vocacional de matemáticos e ingenieros, escribió hace más de treinta años: Con frecuencia se ha visto en la matemática la ciencia fundamental que permea todas las demás ciencias, las cuales aparecen tales en la misma medida que están matematizadas... Las matemáticas constituyen o tejen la estructura formal de todas las ciencias, en cuanto estas son ciencia en un sentido muy estricto, es decir, están impregnadas de una armazón logicodeductiva. La modelación matemática, tan necesaria para abordar los más variados problemas que ocupan a las ciencias y a la ingeniería, precisa en muchos casos de los recursos que se desarrollan en este texto. Los contenidos sobre el análisis de funciones de variable compleja, las ecuaciones diferenciales, las transformadas de Laplace (y otras), las series y la transformada de Fourier, así como el análisis numérico, la dinámica de sistemas y la teoría de distribuciones, que conforman esta obra, deben activar recursos suficientes para adentrarse con éxito en el ámbito del diseño de sistemas discretos y continuos para el tratamiento de las señales en el mundo de la comunicación, en los medios robotizados, en el análisis de los sistemas caóticos -tan frecuentes en los dominios de la física, la química o la economía-, así como en el procesamiento de imágenes y formas de lenguaje, entre otros campos.

Modelado y simulación computacional de incendios en la edificación Alvear, Daniel, 2007-01-01 A pesar de que una gran cantidad de artículos se habían escrito sobre la temática del Modelado y Simulación Computacional de Incendios,

ciertamente, hasta el momento no se había publicado un libro que permitiera recoger una visión actual de los progresos de este campo y sirviera de referencia a los científicos, técnicos y diseñadores de la seguridad contra incendios en edificios e infraestructuras y medios de transporte. Esta obra cubre una necesidad que era evidente en el área del modelado y la simulación de incendios. Además, es importante destacar que, al estar escrito en español, el libro es la primera referenciadisponible en este idioma para los profesionales vinculados al incendio del mundo hispano. INDICE: Prólogo. Presentación. Principios de la dinámica del incendio. Principios del modelado y simulación computacional de incendios. Modelos de simulación computacional de incendios. Ejemplos y aplicaciones de los modelos de zona. Ejemplos y aplicaciones de los modelos de campo. Introducción al modelado y simulación computacional del comportamiento humano en caso de emergencia.

250 Ejercicios Resueltos de Ecuaciones Diferenciales Lineales [incluye Fundamento Teórico],: Con Aplicaciones de Modelado Y Ejercicios Con Valores En Pablo Josué Coronel López, Pedro Pablo Coronel Pérez, 2020-03-19 La EDITORIAL INFINITO presenta con orgullo a la comunidad estudiantil y profesoral el cuarto volumen de la SERIE CORONEL: 250 ejercicios resueltos de Ecuaciones Diferenciales Lineales con aplicaciones de modelado y ejercicios con valores en la frontera. El propósito de este libro es presentar a quienes cursan estudios universitarios, una serie de ejercicios sobre ecuaciones diferenciales, muy representativos y resueltos en forma detallada. Resulta evidente que el contenido de este libro será de gran utilidad en especial para estudiantes de carreras vinculadas a la ingeniería, las ciencias, la tecnología o cualquier especialidad donde el cálculo matemático sea requisito indispensable dentro del pensum de estudio. El número de ejercicios incluidos permite que el libro pueda ser utilizado también como texto tanto por el alumno como por el profesor en el desarrollo de este importante tema de cálculo. En otras palabras, por ser el libro de ecuaciones diferenciales tipo problemario sirve de guía, orientación para la resolución de otros ejercicios más complejos. Lo anterior constituye la esencia y la filosofía del libro de ecuaciones diferenciales. Es por esto, que los ejercicios están resueltos con una metodología que los autores la hemos denominado paso a paso, es decir, detallando en aspectos algebraicos, aspectos donde el estudiante suele tener ciertos tropiezos. Los autores se han esmerado en la explicación de los procedimientos utilizados en la resolución de cada uno de los problemas. Los ejercicios han sido seleccionados con el objeto de ampliar los conocimientos adquiridos en

clase, así como también para que el estudiante adquiera práctica en la resolución de problemas y así prevenirle ante las dificultades con que normalmente se tropieza el estudiante. ¡Esperamos que disfruten de la primera edición de 250 Ejercicios resueltos de Ecuaciones Diferenciales Lineales con aplicaciones de modelado y ejercicios con valores en la frontera! Como siempre, serán bienvenidos los comentarios y sugerencias para continuar mejorando la obra. Las ecuaciones diferenciales son una parte muy importante del análisis matemático y modelan innumerables procesos de la vida real. Una ecuación diferencial es una relación, válida en cierto intervalo, entre una variable y sus derivadas sucesivas. Su resolución permite estudiar las características de los sistemas que modelan y una misma ecuación puede describir procesos correspondientes a diversas disciplinas. Los siguientes ejemplos nos permiten mostrar la importancia que tienen las ecuaciones diferenciales en cuanto a las aplicaciones en las diversas ramas o disciplinas científicas y en la vida real. Crecimiento poblacional: La suposición es que la rapidez a la que crece la población de un país en cierto tiempo es proporcional a la población total del país en ese momento. La ecuación diferencial es $dP/(dT) \propto P$ o $dP/(dT) = kP$. Ley de enfriamiento de Newton: Según la ley empírica de Newton acerca del enfriamiento, la rapidez con que se enfría un objeto es proporcional a la diferencia entre su temperatura y la del medio que lo rodea, que es la temperatura del ambiente. Si $T(t)$ representa la temperatura del objeto en el momento t , T_m es la temperatura constante del medio que lo rodea y dT/dt es la rapidez con que se enfría el objeto. La ley de Newton del enfriamiento se traduce en el enunciado matemático. $dT/dt \propto (T - T_m) \rightarrow dT/dt = K(T - T_m)$. Propagación de una enfermedad: Una gripe se disemina en una comunidad por medio de la gente que entra en contacto con otras personas. Sea $x(t)$ el número de personas que se han contagiado con la enfermedad y $y(t)$ el número de personas que aún no se contagian. La ecuación diferencial es $dx/dt = kxy$.
