Introduction to Geospatial Technologies Bradley A. Shellito, 2013-12-01 Combining both theoretical coverage and

hands-on lab work, and accessible to majors and non-majors alike, Bradley Shellito's Introduction to Geospatial Technologies has become a new favorite for the digital Earth course. The new edition reflects the latest developments in the field, including how scientists are using GIS data with cloud technology. With lab activities that utilize both widely available freeware and ArcGIS, instructors can tailor the course to their students. Introduction to Geospatial Technologies, Second Edition is available in three formats: a paperback edition, a loose-leaf edition, and a fully interactive e-Book.

Use of Remote Sensing to Estimate Paddy Area and Production Lea Rotairo, Asian Development Bank, 2019 A substantial portion of the world's rice is produced and consumed in the Asia and Pacific region. As much of the region's population depends on rice farming for consumption and livelihood, the demand for good quality statistics remains essential for effective policy formulation. Recent advances in remote sensing serve as a viable alternative to traditional methods of compiling agricultural statistics by responding to the emerging data requirements and overall needs of modern agriculture, especially for staple commodities such as rice. This publication outlines the procedures, methods and tools developed for generating statistics on paddy rice area and production using remote sensing and GIS techniques. It is intended to encourage and assist national statistical systems in piloting and adopting satellite-based techniques as an alternative to existing data collection methods, while enabling other interested readers to comprehend whether the adoption of these methodologies can improve the quality and timeliness of agricultural statistics. The handbook also serves as a complement to a massive online open course developed by ADB for crop area estimation.

Introduction to Computational Methods in Many Body Physics Michael Bonitz, Dirk Semkat, 2006 This book is a multi-purpose and user-friendly textbook covering both fundamentals (in thermodynamics and statistical mechanics) and numerous applications. The emphasis is on simple derivations of simple results which can be compared with experimental data. The first half of the book covers basic thermodynamics, statistical ensembles, Boltzmann and quantum statistics; and the second half covers magnetism, electrostatic interactions (solutions and plasmas), non-equilibrium statistical mechanics, polymers, superfluidity, renormalization theory, and other specialized topics. This book, while serving well as a reference book for research scientists, is especially suitable as a textbook for a one-year statistical mechanics course for undergraduate students in physics, chemistry, engineering, biology, and material sciences. Alternatively, the first 5 chapters of the book can be used as the textbook for an undergraduate one-semester combined thermodynamics/statistical mechanics course (or statistical thermodynamics).
