Teaching Motor Skills to Children with Cerebral Palsy and Similar Movement Disorders Sieglinde Martin, 2006 This book provides parents with help for children with cerebral palsy or other developmental delay master gross motor skills beginning in infancy. Organised in the sequence children acquire gross motor skills, this guide explains how motor development unfolds, and how cerebral palsy can affect it.

Pediatric Neurology Part I Carol L. Richards, Francine Malouin, 2013-04-24 Over the last 25 years the definition and classification of cerebral palsy (CP) have evolved, as well as the approach to rehabilitation. CP is a disorder of the

development of movement and posture, causing activity limitations attributed to nonprogressive disturbances of the fetal or infant brain that may also affect sensation, perception, cognition, communication, and behavior. Motor control during reaching, grasping, and walking are disturbed by spasticity, dyskinesia, hyperreflexia, excessive coactivation of antagonist muscles, retained developmental reactions, and secondary musculoskeletal malformations, together with paresis and defective programming. Weakness and hypoextensibility of the muscles are due not only to inadequate recruitment of motor units, but also to changes in mechanical stresses and hormonal factors. Two methods, the General Movements Assessment and the Test of Infant Motor Performance, now permit the early detection of CP, while the development of valid and reliable outcome measures, particularly the Gross Motor Function Measure (GMFM), have made it possible to evaluate change over time and the effects of clinical interventions. The GMFM has further led to the development of predictive curves of motor function while the Gross Motor Classification System and the Manual Ability Classification System provide standardized means to classify the severity of the movement disability. With the emergence of the task-oriented approach, the focus of therapy in rehabilitation has shifted from eliminating deficits to enhancing function across all performance domains by emphasizing fitness, function, participation, and quality of life. There is growing evidence supporting selected interventions and interest for the therapy and social integration of adults with CP.

Psychometric Properties of the Gross Motor Function Classification System for Children with Cerebral Palsy Sherif Salib, 2003 The objective of this thesis was to evaluate the construct validity, the inter-rater reliability and the prognostic potential of the Gross Motor Function Classification System (GMFCS). The analysis was carried out in a cohort of 111 children with cerebral palsy who participated in the HBO Study for children with cerebral palsy; a randomized multicentre clinical trial. Construct validity was examined by correlating the results from the GMFCS with that of the Gross Motor Function Measure (GMFM), the Pediatric Evaluation of Disability Inventory (PEDI) and the JEBSEN test of hand function. The inter-rater reliability of the GMFCS was explored by comparing the GMFCS values calculated by one therapist, using the HBO Study pre-trial patient charts, with those of another physical therapist who was blinded to the initial scores done earlier on the same records, and who was well-versed in the GMFCS. The prognostic properties of the GMFCS were examined by comparing, within each of the GMFCS levels, the mean change over time, for the GMFM, the PEDI, and the JEBSEN. --
