An image bank, containing all the images in the text, will be available to faculty.

Marks' Basic Medical Biochemistry Michael Lieberman, Alisa Peet, 2017-07-17 This core textbook helps medical students bridge the gap between biochemistry, physiology, and clinical care. The strength of Mark's Basic Medical Biochemistry is that it starts with the patient--the metabolic and nutritional needs of the human body (easy for students to understand)--as opposed to explanations of complex chemical theory. Mark's Basic emphasizes clinical correlations throughout the text and links biochemical concepts to physiology and pathophysiology, using patient vignettes as the context. These specific and memorable mock patient cases are followed throughout the chapter to pose questions, illustrate core concepts, and help students remember and apply biochemical principles within the context of clinical practice--Provided by publisher.

**Practical Forensic Pathology and Toxicology** Dorothy E. Dean,Robert H. Powers,2024-11-15 Practical Forensic Pathology and Toxicology is a companion to the authors' original book on the subject, Forensic Toxicology: Mechanisms and Pathology. This new volume addresses issues that forensic pathologists face when confronted by the suspected or demonstrated presence of drugs or toxins in their cases. Since such considerations include the need for a basic understanding of the direct physiological effects of potentially toxic agents, the authors highlight various connections and interaction between forensic pathology and toxicology. The book is written for both the practicing pathologist, and those in training, who may already have some knowledge of forensic medicine but are on occasion faced with issues that reach beyond a basic determination of cause and manner of death. Pathologists are expected to provide informed, well-reasoned opinions explaining how a person died—which includes questions about any drugs, prescription medications, or otherwise that may have caused or contributed to death. As such, this book looks at the direct physiological effects of drugs and toxins, answering questions such as “Why does hypernatremia cause seizures?” or “Why can synthetic cannabinoids cause fatal complications, yet THC does not?” or the very timely “What is the mechanism by which an opiate overdose causes death?” Coverage primarily centers on the pathological derangements and physiological consequences of the actions of drugs and toxins, and the cellular mechanisms by which those pathological consequences arise. Organized using an organ system approach, sections are divided into major target organ systems and sections included for affected organs and tissues. While some drugs affect more than one organ system—and some patients will have multiple drugs present—the book's

categorization and organization take this approach to be readily usable for the reader. Case reports are included with additional patient data to show the effects of specific toxins and poisons both alone and in combination with natural disease. Color figures illustrate all aspects of drug or toxin impact on postmortem casework including the scene of death, the deceased persons, and the organs and tissues affected. Practical Forensic Pathology and Toxicology is an invaluable resource for practicing pathologists, toxicologists, and those training for those fields. It also serves as a useful reference for lawyers, judges, insurance companies, and other medical professionals who need to know, in light of what drugs are present in a particular case, what such compounds do, and how their presence (or absence thereof) is—or is not—related to an individual's death.

Elementary Medical Biochemistry J. M. M. Brown, G. G. Járos, 2013-10-22 Elementary Medical Biochemistry deals with the biochemical basis of the process of life, particularly, the principles of metabolic processes and the systems controlling these processes. The book reviews matter, energy, and the molecular transport processes in the body (known as diffusion, osmosis, filtration, active transport, circulation). The text also describes the medical uses of oxygen, and its functions together with hydrogen, carbon, and nitrogen. The book explains the importance of minerals in the body such as sodium, potassium,

calcium, magnesium, iron, chlorine, phosphorus, sulfur, the trace elements (copper, manganese, cobalt), and other elements (nickel, cadmium, vanadium). Chemical reactions either form or break chemical bonds resulting in an uptake or release of energy. The book explains the various factors affecting the rate at which a chemical reaction occurs. These factors include temperature, concentration of reagents, or enzymes. The text also describes the metabolic fate of pyruvic acid, the glycolysis in muscle tissue, and the handling of end-products of metabolism by the body. The book is intended for students of nursing with diploma courses in general obstetrics and psychiatric nursing.
