Modeling of Instrument Landing System (ILS) Localizer Signal on Runway 25L at Los Angeles International Airport National Aeronautics and Space Administration (NASA),2018-07-05 A joint NASA/FAA flight test has been made to record instrument landing system (ILS) localizer receiver signals for use in mathematically modeling the ILS localizer for future simulation studies and airplane flight tracking tasks. The flight test was conducted on a portion of the ILS localizer installed on runway 25L at the Los Angeles International Airport. The tests covered the range from 10 to 32 n.mi. from the localizer antenna. Precision radar tracking information was compared with the recorded localizer deviation data. Data analysis showed that the ILS signal centerline was offset to the left of runway centerline by 0.071 degrees and that no significant bends existed on the localizer beam. Suggested simulation models for the ILS localizer are formed from a statistical analysis. Hueschen, Richard M. and Knox, Charles E. Langley Research Center RTOP 505-64-13-04...

Instrument Landing System (ILS) Localizer Performance Study for Dallas/Fort Worth Airport L. Jordan,D. Kahn,S. Morin,R. Silva,TRANSPORTATION SYSTEMS CENTER CAMBRIDGE MA.,1974 The Transportation Systems Center electromagnetic scattering model was used to predict the course deviation indication (CDI) at the Dallas/Fort Worth Airport in the presence of several derogating structures in the report FAA-RD-72-96 'ILS Localizer Performance Study Part 1 Dallas/Fort Worth Regional Airport and Model Validation-Syracuse Hancock Airport.' In this report the recommendation was made to use a capture effect system localizer. In the present report several additional structures, the Braniff and Delta

hangar buildings, are modeled. Using the recommended capture effect localizer, it is found that these two additional structures do not add significantly to the derogation, and the category 1 and category 2 operation is still possible on the four instrumented runways tested. (Author).

Interference Predictions for the Instrument Landing System Gary D. Gierhart,M. E. Johnson,1965 Co-channel and adjacent-channel interference predictions for the Instrument Landing System are presented in this report.Information on the various types of ground facilities involved is given * first.Propagation mechanisms applicable to the 108 to 112 Mc/s frequency range are discussed second together with the calculation of transmission loss and its variability. Third, the statistical treatment of interference problems is explained.Finally, the results of the study are presented as curves of normalized desired-to undesired signal strength ratios versus distance from the desired station.Aircraft altitudes of 1,000, 6,250, 12,000, and 18,000 feet along with station separations ranging from 20 to 330 nautical miles were considered. Detailed procedures, mathematical formulas, and computer programs used are discussed in the Appendices.(Author).
