Michael Perryman

Solar System Evolution Stuart Ross Taylor, 2001-09-06 Publisher Description

Solar System Evolution Stuart Ross Taylor, 2005-07-14 This completely rewritten new edition begins with a historical perspective of the place of the solar system in the universe. Evidence from meteorites is used to describe how the planets were formed and the giant planets are considered in the light of the discovery of new extrasolar giants. Other chapters discuss satellites, comets, centaurs, asteroids and why Pluto is not a planet. Explanations on why Earth and Venus turned out so differently, and how Mars and Mercury are the survivors of many similar bodies, are also discussed.

The Origin and Evolution of the Solar System Michael M. Woolfson, 2000-01-01 The origin of the solar system has been a matter of speculation for many centuries, and since the time of Newton it has been possible to apply scientific principles to the problem. A succession of theories, starting with that of Pierre Laplace in 1796, has gained general acceptance, only to fall from favor due to its contradiction in some basic scientific principle or new heavenly observation. Modern observations by spacecraft of the solar system, the stars, and extra-solar planetary systems continuously provide new information that may be helpful in finding a plausible theory as well as present new constraints for any such theory to satisfy. *The Origin and Evolution of the Solar System* begins by describing historical (pre-1950) theories and illustrating why they became unacceptable. The main part of the book critically examines five extant theories, including the current paradigm, the solar nebula theory, to determine how well they fit with accepted scientific principles and observations. This analysis shows that the solar nebula theory satisfies the principles and observational constraints no better than its predecessors. The capture theory put forward by the author fares better and also indicates an initial scenario leading to a causal series of events that explain all the major features of the solar system.

Formation, Evolution, and Dynamics of Young Solar Systems Martin Pessah, Oliver Gressel, 2017-12-04 This book's interdisciplinary scope aims at bridging various communities: 1) cosmochemists, who study meteoritic samples from our own solar system, 2) (sub-) millimetre astronomers, who measure the distribution of dust and gas of star-forming regions and planet-forming discs, 3) disc modellers, who describe the complex photo-chemical structure of parametric discs to fit these to observation, 4) computational astrophysicists, who attempt to decipher the dynamical structure of magnetised gaseous discs, and the effects the resulting internal structure has on the aerodynamic re-distribution of embedded solids, 5) theoreticians in

planet formation theory, who aim to piece it all together eventually arriving at a coherent holistic picture of the architectures of planetary systems discovered by 6) the exoplanet observers, who provide us with unprecedented samples of exoplanet worlds. Combining these diverse fields the book sheds light onto the riddles that research on planet formation is currently confronted with, and paves the way for a comprehensive understanding of the formation, evolution, and dynamics of young solar systems. The chapters 'Chondrules - Ubiquitous Chondritic Solids Tracking the Evolution of the Solar Protoplanetary Disk', 'Dust Coagulation with Porosity Evolution' and 'The Emerging Paradigm of Pebble Accretion' are published open access under a CC BY 4.0 license via link.springer.com.

Formation Of The Solar System, The: Theories Old And New (2nd Edition) Michael Mark Woolfson, 2014-09-11 This fully-updated second edition remains the only truly detailed exploration of the origins of our Solar System, written by an authority in the field. Unlike other authors, Michael Woolfson focuses on the formation of the solar system, engaging the reader in an intelligent yet accessible discussion of the development of ideas about how the Solar System formed from ancient times to the present. Within the last five decades new observations and new theoretical advances have transformed the way scientists think about the problem of finding a plausible theory. Spacecraft and landers have explored the planets of the Solar System, observations have been made of Solar-System bodies outside the region of the planets and planets have been detected and observed around many solar-type stars. This new edition brings in the most recent discoveries, including the establishment of dwarf planets and challenges to the 'standard model' of planet formation — the Solar Nebula Theory. While presenting the most up-to-date material and the underlying science of the theories described, the book avoids technical jargon and terminology. It thus remains a digestible read for the non-expert interested reader, whilst being detailed and comprehensive enough to be used as an undergraduate physics and astronomy textbook, where the formation of the solar system is a key part of the course. Michael Woolfson is Emeritus Professor of Theoretical Physics at University of York and is an award-winning crystallographer and astronomer.

Formation Of The Solar System, The: Theories Old And New Michael Mark Woolfson,2007-10-29 This book traces the development of ideas about the origin of the Solar System from ancient times to the present day. A survey of more modern ideas, covering the last 200 years or so, highlights the difficulties experienced by theories and also points the way towards the development of a more successful theory. In particular, the current “standard model” — the Solar Nebula Theory — is examined and discussed in some detail. After more than thirty years of development, this theory has still not settled down into an agreed form, as it experiences both theoretical difficulties and problems with reconciling new observations. By contrast, the Capture Theory, developed over the last forty years by the author, and supported by recent observations provides a complete description of the formation of the Solar System, including an evolutionary hypothesis that explains the detailed structure of the system. Written in an informative yet accessible manner, this book will appeal to both specialist and non-specialist readers alike./a

Comets as Tracers of Solar System Formation and Evolution Kathleen Mandt,Olivier Mousis,Dominique Bockelée-

Morvan, Christopher Russell, 2017-06-09 This volume is a compilation of an International Workshop on Comets as Tracers of Solar System Formation and Evolution that was held in Toulouse, France, from April 1-3, 2014, meant to prepare the community for the task of placing Rosetta observations within the greater context of using comets as tracers of solar system formation and evolution. More than 100 scientists from 18 different countries participated in this three-day science program, which was comprised of themed sessions and featured a mixture of invited reviews, invited and contributed talks and posters. These invited speakers included many of the community leaders in cometary science, measurements and technology development. The workshop covered topics ranging from the dynamical and chemical evolution of the solar nebula during formation, to the techniques for measuring the composition of comets. Of particular focus was the role that measurements made by Rosetta could be expected to play in understanding the origin of solar system bodies. The purpose of this volume is to build upon the results of this workshop, providing a formal record of the state of knowledge leading into the Rosetta mission. Planet Formation and Evolution in Our Solar System and Beyond John Brooks Biersteker, 2019 The discovery of thousands of exoplanets in recent decades has revealed a remarkable diversity of planetary system architectures, including entire classes of planets for which there is no solar system analog. In particular, the Kepler mission has shown that planets intermediate in size between Earth and Neptune with orbital periods less than 100 days are abundant in our galaxy. Concurrently, spacecraft missions to small primitive bodies in our solar system have yielded valuable insights into conditions in the early solar system. This thesis addresses questions in planet formation theory arising from both sets of observations. We begin with an investigation into the observed diversity of super-Earth bulk densities, which range from being consistent with a terrestrial composition to requiring an extended hydrogen-helium (H/He) envelope comprising several percent of the planet's mass. Giant impacts are expected to play a role in the formation of these worlds. We examine the thermal consequences of such an impact, and find that atmospheric loss from these effects can significantly exceed that caused by the previously considered process of mechanical shocks for H/He atmospheres. Specifically, the energy released can produce a period of sustained, rapid mass loss through a Parker wind, partly or completely eroding the envelope. The degree of loss depends on planetary properties and the stochastic details of the impact, making giant impacts an attractive explanation for the observed diversity of super-Earth compositions. The final assembly of the terrestrial planets in our solar system likely also concluded with a period of giant impacts. We explore the significance of post-impact thermal losses for terrestrial planet atmospheres in different evolutionary states, finding that H/He envelopes are unlikely to survive the giant impact phase, but that secondary, outgassed envelopes with higher mean molecular weights may be retained. Atmospheric constituents with high mean molecular weights may be lost, however, if they are mixed into a predominantly H/He envelope. Next, this thesis examines magnetic measurements of comet 67P/Churyumov-Gerasimenko (67P) and their implications for the early solar

system environment. Specifically, the remanent magnetization of solar system bodies reflects their accretion mechanism, the space environment in which they formed, and their subsequent geological evolution. We show that the Rosetta magnetometry requires very low bulk magnetizations of cometary material on spatial scales ≥ 10 cm. If 67P formed during the lifetime of the solar nebula and has not undergone significant subsequent alteration, this low magnetization is inconsistent with its formation from the gentle gravitational collapse of a cloud of millimeter-sized pebbles in a background magnetic field $\geq \sim 3$ μ T. This constraint is compatible with theories of magnetically driven evolution of protoplanetary disks. Lastly, this thesis presents the first attempt to determine an exoplanet's oblateness and obliquity through the use of changes in the transit depth caused by the spin precession of an oblate planet. Determination of these quantities would provide insights into a planet's internal structure and formation history. Using Kepler photometry, we examine the brown dwarf Kepler-39b and the warm Saturn Kepler-427b. We do not usefully constrain the oblateness of Kepler-39b, but we find transit depth variations for Kepler-427b at 90% significance consistent with a precession period of 5.5 years and an oblateness comparable to solar system gas giants.
