*The Selfish Gene (summary)* Richard Dawkins, 2004

**Summary of The Selfish Gene** Alexander Cooper, 2021-10-09 Summary of The Selfish Gene In his book, The Selfish Gene, Dawkins argues for the gene as the basic unit of evolution. He claims that organisms are “survival shells” for the “replicators” within us. Replicators, the units that evolve, are genes. They are inherently selfish in that they only care about their own survival and the survival of their copies. As a result, no true altruism exists. Anytime an organism helps another, both sets of genes are benefiting. Dawkins expands his theory to attempt to explain topics like kin altruism, eusociality, group dynamics and culture. He writes for the scientist looking for a new idea and for the layman just looking to learn more by explaining his theory in a way that appeals to all. **SUMMARY - The Selfish Gene By Richard Dawkins** Shortcut Edition, 2021-06-17 \* Our summary is short, simple and pragmatic. It allows you to have the essential ideas of a big book in less than 30 minutes. As you read this summary, you will discover that in nature, altruism does not exist. All living species are genetically selfish. You will also discover : that your genes have created you for their own survival; that your children will be naturally selfish, but that you have the means to change that through culture; that in terms of reproduction, the male is less involved than the female; that since the appearance of modern man, genetic evolution is no longer the only type of evolution in the world. The selfish gene theory is another facet of Darwin's theory. Rather than focusing on the individual organism, it takes the point of view of genetics. Your genes survived in a world where competition was raging, so the predominant quality in a gene that thrived is certainly ruthless selfishness. A selfishness that inevitably affects individual behavior. But by understanding what your genes are tending towards - selfishness - you may have a chance to counteract them and achieve what no other species has ever achieved: becoming an altruistic individual. selection developed by Charles Darwin. This classic is focused on the nature of altruism and selfishness that creatures have. Despite that any living creature is focused on his well-being, the study reveals that they have a natural sense of altruism as well. Many creatures have a tendency of sacrificing themselves for their loved ones' safety. (Note: This summary is wholly written and published by Readtrepreneur. *Summary of The Selfish Genes* Alexander Cooper, 2021-07-31 Summary of The Selfish Genes Has The Egocentric Gene by Richard Dawkins been waiting for you on your study list? Choose the important thing ideas inside the e book with this brief summary. Over 3.5 billion years ago, in a primordial soup of molecules, the primary, most effective form of life on the planet came to be: a molecule able to reproduce itself, a replicator. Molecular replicators are made from lengthy chains of smaller building-block molecules in the same manner that a phrase is made up of a string of letters. Replicators reproduce themselves via attracting different 'letters' and performing as a template for them to fit into. The primary replicator routinely had a competitive edge over all the different molecules within the primordial soup because they could not replicate themselves, and subsequently the replicators have become more numerous than every other sort of molecule. But, mistakes inside the copying system led to 'daughter' replicators that had a slightly different configuration than their 'parent.' These new configurations supposed that a few 'daughters' had been able to reproduce themselves faster, or more correctly, giving them a competitive advantage over their 'parent.' An increasing number of replicators have been built from the finite deliver of constructing-block molecules within the primordial soup, and those molecules were step by step used up. Those two principles – a population in which ability varies and an surroundings of restrained sources – are the primary requirements for the system we recognize as evolution. As time went on, similar mistakes in copying resulted in new high quality traits, inclusive of the capacity to interrupt other replicators and use their constructing blocks for replication: the primary carnivores. Through the introduction of latest variations, and the survival of the replicators with the maximum beneficial blessings, greater complex existence forms emerged, in the end ensuing in the type of organisms we see today. *Quicklet on Richard Dawkins' The Selfish Gene (CliffNotes-like Book Summary & Analysis)* Elspeth Michaels, 2012-07-30

ABOUT THE BOOK In a 2006 interview with Meet the Author, the year when *The Selfish Gene* celebrated its 30th anniversary, Richard Dawkins had this to say: "...If I had to write it again, I wouldn't write it very differently. It has been described as a revolutionary book, in one respect it is. But it's only a revolutionary way in looking at orthodox Darwinian natural selection. It helps to look at it in this revolutionary way. It could equally well have been called "the Altruistic Animal," because if you have selfish genes, which only means that natural selection works at the level of the gene; if you have selfish genes, then you may have altruistic individuals. And that's what the book is about." What Dawkins describes as "revolutionary," others have construed as controversial. When *The Selfish Gene* was first published in 1976, it created a number of waves within the study evolutionary biology, largely dominated by Darwinian doctrine. (One could say it made a splash in the gene pool.) If Darwin's idea of natural selection was based on the concept of "survival of the fittest," then why does altruism exist between individuals? Why aren't all living things selfish in a cut-throat battle for survival? Dawkins strove to explain altruism in *The Selfish Gene*, with the argument that altruistic behavior can be explained through the selfishness of our genes. EXCERPT FROM THE BOOK If it runs away, chase it! If it comes at you, fight back.) In a relationship such as prey versus predator, Dawkins explains possible strategies. A retaliator doesn't attack aggressively, but will act in a threatening manner. If the opponent attacks first, the retaliator will, as you guessed, retaliate. Retaliators behave based upon their opponent's behavior, making them conditional strategists. In addition to retaliators, there are two other kinds of conditional strategies: bullies and prober-retaliators. A bully attacks until an opponent strikes back, in which case, the bully immediately retreats. Prober-retaliators are essentially retaliators, but can initiate an attack like a bully, and if the opponent fights back, will defend itself. In these strategies, the retaliator is an ESS, the prober-retaliator is nearly stable, and the bully is not stable. Chapter 6: Genemanship The key point of this chapter is that genes might be able to assist replicas of itself that are sitting in other bodies. If so, this would appear as individual altruism but it would be brought about by gene selfishness. (88) In the previous chapter, Dawkins explained aggression through individual, independent selfish machines. However, individuals have relatives, in the form of siblings, cousins, parents, etc., all of whom share many of the same genes. Each selfish gene then, has its loyalties divided among different individuals; the selfish gene is every replica of itself. Dawkins explains how a gene selected for kin-altruism, could survive in the gene pool. A gene that suicidally saves five cousins would not be numerous in a population of individuals, however, if it saved five brothers or ten first cousins would. The minimum requirement for a suicidal altruistic gene to be a successful one in the gene pool would have to "save more than two siblings/children/parents, more than four half-siblings/uncles/aunts/nephews/nieces/grandparents/grandchildren, or more than eight first cousins, etc."

Dawkins has experienced an endless amount of notable events in his life, many of which were very public, such as debates, conference, and television appearances. In this second volume of his memoirs, these life experiences have inspired memories of other events, background stories of people he knew, and scientific analysis of Dawkins' theories of evolution, natural selection, biology, and religion, particularly atheism versus creationism. From 1970 to 1990, Dawkins served as University Lecturer in Animal Behaviour in the zoology department at Oxford University, and from 1990 to 1995, he was promoted to Reader. He also gave tutorials in New College, where he was made a fellow in 1970. He served on a number of committees, including a committee that discussed candidates to invite to attend the school...
