Investigation of Wings in Ground Effect using Computational Fluid Dynamics Gulraiz Ahmed, 2012-07-05 Master's Thesis from the year 2008 in the subject Engineering - Aerospace Technology, grade: A, University of Southampton, course: Computational Aerodynamics, language: English, abstract: Wing-in-ground effect (WIG) vehicles offer an exciting capability to fill the enormous void between speed of an aircraft and the payload capacity of a ship. WIG vehicles would be able to move cargo and passengers faster than a ship and more economical than an aircraft. Ground effect is a phenomenon that occurs on all wings flying close to the ground or a surface. The aim of this project is to investigate the behavior of wings (NACA/DHMTU series) in ground effect (on a fixed/variable terrain) using Fluent CFD package. The NACA 0012 and DHMTU series used in this project are designed specifically to fly in close proximity to the ground. The performance of the NACA/DHMTU airfoils is examined for the lift and the drag coefficients at different altitudes with varying angle of attack. The results are compared to experimental data that is available to assess the accuracy of the CFD simulation.

WIG Craft and Ekranoplan Liang Yun, Alan Bliault, Johnny Doo, 2009-12-03 In the last half-century, high-speed water transportation has developed rapidly. Novel high-performance marine vehicles, such as the air cushion vehicle (ACV), surface effect ship (SES), high-speed monohull craft (MHC), catamaran (CAT), hydrofoil craft (HYC), wave-piercing craft (WPC) and small water area twin hull craft (SWATH) have all developed as concepts, achieving varying degrees of commercial and military success. Prototype ACV and SES have achieved speeds of 100 knots in at calm con- tions; however, the normal cruising speed for commercial operations has remained around 35-50 knots. This is partly due to increased drag in an average coastal s- way where such craft operate services and partly due to limitations of the propulsion systems for such craft. Water jets and water propellers face limitations due to c- itation at high speed, for example. SWATH are designed for reduced motions in a seaway, but the hull form is not a low drag form suitable for high-speed operation. So that seems to lead to a problem - maintain water contact and either water propulsion systems run out of power or craft motions and speed loss are a problem in higher seastates. The only way to higher speed would appear to be to disconnect completely from the

water surface. You, the reader, might respond with a question about racing hydroplanes, which manage speeds of above 200 kph. Yes, true, but the power-to-weight ratio is extremely high on such racing machines and not economic if translated into a useful commercial vessel.

Wing in Ground Effect Aircraft NORMAN J. LEONARD, 2025-05-22 The genesis of this research was the USAF Scientific Advisory Board's advanced air and space ideas study, New World Vistas, and its mobility volume's analysis of the WIG. This research project was a more in-depth look into the WIG's feasibility and capability. The research looked at how the WIG helps meet the national security strategy of global engagement, and the resulting growth in expeditionary demands on the DoD. Thus, the research question was: Should the WIG be the DoD's next mobility platform? This research decomposed the basic research question into two: (1) Does the DoD have a strategic lift shortfall based on National Military Strategy? and (2) Should the WIG be the mobility platform of choice, based on requirements, unique characteristics, and technology? First, the analysis focused on the national security strategy, the resulting national military strategy, the USAF Strategy, and rapid global military service requirements, based on these needs, and finally, the culminating mobility shortfalls associated with these strategies, to include the Mobility Requirements Study for 2005. Second, the analysis focused on future airlift requirements, platform alternatives, unique WIG characteristics and the factors that favor the WIG, a Korean scenario using ASCAM and a WIG fleet, the multiple uses and affordability of the WIG, and the technological vision and guidance from the new administration. Overall, this study establishes the importance, and shortfall, of mobility airlift in meeting the nation's global engagement strategy, and the fact that, because of its unique characteristics, the WIG is the platform of choice to help fulfill this global strategy as the DoD's strategic airlifter of the future. Aerodynamics of a Lifting System in Extreme Ground Effect Kirill V. Rozhdestvensky, 2013-03-09 This book is dedicated to the memory of a distinguished Russian engineer, Rostislav E. Alexeyev, who was the first in the world to develop

the largest ground effect machine - Ekranoplan. One of Alexeyev's design concepts with the aerodynamic configuration of a jlying wing can be seen on the front page. The book presents a description of a mathematical model of flow past a lifting system, performing steady and unsteady motions in close proximity to the underlying solid surface (ground). This case is interesting for practical purposes because both the aerodynamic and the economic efficiency of the system near the ground are most pronounced. Use of the method of matched asymptotic expansions enables closed form solutions for the aerodynamic characteristics of the wings-in-ground effect. These can be used for design, identification, and processing of experimental data in the course of developing ground effect vehicles. The term extreme ground effect, widely used through out the book, is associated with very small relative ground clearances of the order of 10% or less. The theory of a lifting surface, moving in immediate proximity to the ground, represents one of the few limiting cases that can be treated analytically. The author would like to acknowledge that this work has been influenced by the ideas of Professor Sheila E. Widnall, who was the first to apply the matched asymptotics techniques to treat lifting flows with the ground effect. Saint Petersburg, Russia February 2000 Kirill V. Rozhdestvensky Contents 1. Flight Evaluation of Ground Effect on Several Low-aspect-ratio Airplanes Paul A. Baker,William G. Schweikhard,William Raymond Young,1970 A constant-angle-of-attack-approach technique was used to measure ground effect on several low - aspect-ratio aircraft. The flight results were compared with results from constant -altitude flybys, wind-tunnel studies, and theoretical prediction data. It was found that the constantangle-of-attack technique provided data that were consistent with data obtained from constant-altitude flybys and required fewer runs to obtain the same amount of data. The test results from an F5D-1 airplane modified with an ogee wing, a prototype F5D-1 airplane, two XB-70 airplanes, and an F-104A airplane indicate that theory and wind-tunnel results adequately predict the trends caused by ground effect as a function of height and aspect ratio. However, the magnitude of these predictions did not always agree with the flightmeasured results. In

addition, there was consistent evidence that the aircraft encountered ground effect at a height above one wing span.

Aerodynamic Performance of a Wing in Ground Effect Using the PANAIR Program A. R. Goetz, AIR FORCE INST OF TECH WRIGHT-PATTERSON AFB OH SCHOOL OF ENGINEERING., 1984 The primary objective of this thesis is to correlate computed theoretical data with experimental data for wings in ground effect. This investigation uses the PANAIR computer program--a higher-order panel method to predict the lift and drag characteristics of an aspect ratio two wing, with and without endplates, operating at low speed in ground effect. The effects of altitude, trailing edge flap deflection and angle of attack are considered. Numerical results are compared with subsonic wind tunnel experimental data. For both the numerical and experimental methods, the image model technique is used to simulate ground effect. Excellent agreement between numerical results and experimental data is achieved for the wing without endplates down to low (approximately 10% of wing chord) altitudes. For the wing with endplates, numerical results are in good agreement with experimental data for altitudes greater than approximately 20% of the wing chord. PANAIR results diverged from experimental data at lower altitudes because the model did not attempt to account for spanwise flow between the bottom of the endplate and the ground, and other viscous effects which tend to become dominant. These include a static pressure increase beneath the wing and wake distortions behind the configuration. Keywords include: Aspect ratio, WIG(Wing in Ground Effect), Lift coefficients, Lift drag ratio, and Inviscid theory.
