Egg Innovations and Strategies for Improvements Patricia Hester, 2016-12-19 Egg Innovations and Strategies for Improvements examines the production of eggs from their development to human consumption. Chapters also address consumer acceptance, quality control, regulatory aspects, cost and risk analyses, and research trends. Eggs are a rich source of macro- and micronutrients which are consumed not only by themselves, but also within the matrix of food products, such as pastas, cakes, and pastries. A wholesome, versatile food with a balanced array of essential nutrients, eggs are a staple of the human diet. Emerging strategies entail improvements to the composition of eggs via fortification or biological enrichment of hen's feed with polyunsaturated fatty acids, antioxidants, vitamins, or minerals. Conversely, eggs can be a source of food-borne disease or pollutants that can have effects on not only human health, but also egg production and commercial viability. Written by an international team of experts, the book presents a unique overview of the biology and science of egg production, nutrient profiling, disease, and modes for increasing their production and quality. Designed for poultry and food scientists, technologists, microbiologists, and workers in public health and the food and egg industries, the book is valuable as an industrial reference and as a resource in academic libraries. - Focuses on the production and food science aspects of eggs - Includes a broad range of microbial contaminants, their risks, and prevention, as well as non-microbial contaminant risks - Presents analytical techniques for practical application

Advances in understanding and optimizing egg natural defenses against pathogens Dr Nicolas Guyot, Dr Sophie Réhault-Godbert, 2025-11-14 The chicken egg is a valuable source of macronutrients and micronutrients of high interest for the human diet. Besides these nutrients, it also contains numerous bioactive molecules and a sophisticated antimicrobial defense system, that are initially required for the development and protection of the bird embryo outside the maternal body. In table eggs (unfertilized eggs), these natural defenses help in protecting the egg, particularly the nutrient-rich egg yolk, from bacterial contamination, and thereby contribute to the hygienic quality of eggs. The aim of this chapter is to highlight the complexity and diversity of the egg antimicrobial defenses, their physical/physicochemical and antimicrobial properties and the factors responsible for the variability of these properties. The chapter includes sections describing each protective layer, namely the eggshell, egg white and the vitelline membrane, as well as a section reviewing the main antimicrobial proteins identified in the egg.
