Cooling Towers and Chilled Water Systems Ricardo de Freitas Fernandes Pontes, 2024-10-15 Cooling Towers and Chilled Water Systems: Design, Operation, and Economic Analysis is a guide to the design and operation of cooling systems within high temperature settings. The book presents various strategies to increase the turndown of cooling towers and chilled water systems and provides a toolkit for engineers to determine the use of variable frequency drivers. A guide to equipment selection for optimal design during the detailed engineering phase is provided, ensuring the reader is able to comply with the project specification within budget. Sections discuss various systems, circuits and processes for cooling tower and chiller systems before detailing design principles. Operational and control strategies are then discussed before a thorough analysis of economic factors, making this book idea for professional engineers, graduate students and researchers working in high-temperature settings, such as power generation or chemical plants. - Presents strategies and tools for engineers to develop and manage efficient cooling towers and chilled water systems - Analyzes the economic benefits of cooled water system designs through the full lifecycle, instructing the reader on how to accurately estimate operating costs - Guides the reader through appropriate equipment selection to comply with project needs

Modeling and Simulation in Thermal and Fluids Engineering Krishnan Murugesan, 2022-07-29 This textbook comprehensively covers the fundamentals behind mathematical modeling of engineering problems to obtain the required solution. It comprehensively discusses modeling concepts through conservation principles with a proper blending of mathematical expressions. The text discusses the basics of governing equations in algebraic and differential forms and examines the importance of mathematics as a tool in modeling. It covers important topics including modeling of heat transfer problems, modeling of flow problems, modeling advection-diffusion problems and Navier-Stokes equations in depth. Pedagogical features including solved problems and unsolved exercises are interspersed throughout the text for better understanding. The textbook is primarily written for senior undergraduate and graduate students in the field of mechanical engineering for courses on modeling and simulation. The textbook will be accompanied by teaching resource including a solution manual for the instructors.

Introduction to Engineering Heat Transfer G. F. Nellis, S. A. Klein, 2020-07-30 This new text integrates fundamental theory with modern computational tools such as EES, MATLAB®, and FEHT to equip students with the essential tools for

designing and optimizing real-world systems and the skills needed to become effective practicing engineers. Real engineering problems are illustrated and solved in a clear step-by-step manner. Starting from first principles, derivations are tailored to be accessible to undergraduates by separating the formulation and analysis from the solution and exploration steps to encourage a deep and practical understanding. Numerous exercises are provided for homework and self-study and include standard hand calculations as well as more advanced project-focused problems for the practice and application of computational tools. Appendices include reference tables for thermophysical properties and answers to selected homework problems from the book. Complete with an online package of guidance documents on EES, MATLAB®, and FEHT software, sample code, lecture slides, video tutorials, and a test bank and full solutions manual for instructors, this is an ideal text for undergraduate heat transfer courses and a useful guide for practicing engineers.

Convective Heat and Mass Transfer in Porous Media Sadik Kakaç,Birol Kilis, Frank A. Kulacki, Faruk Annç, 2012-12-06

The rapid growth of literature on convective heat and mass transfer through porous media has brought both engineering and fundamental knowledge to a new state of completeness and depth. Additionally, several new questions of fundamental merit have arisen in several areas which bear direct relation to further advancement of basic knowledge and applications in this field. For example, the growth of fundamental heat transfer data and correlations for engineering use for saturated media has now reached the point where the relations for heat transfer coefficients and flow parameters are known well enough for design purposes. Multiple flow field regimes in natural convection have been identified in several important enclosure geometries. New questions have arisen on the nature of equations being used in theoretical studies, i. e. , the Validity of Darcy assumption is being brought into question; Wall effects in high and low velocity flow fields have been found to play a role in predicting transport coefficients; The formulation of transport problems in fractured media are being investigated as both an extension of those in a homogeneous medium and for application in engineering systems in geologic media and problems on saturated media are being addressed to determine their proper formulation and solution. The long standing problem of how to adequately formulate and solve problems of multi-phase heat and mass transfer in heterogeneous media is important in the technologies of chemical reactor engineering and enhanced oil recovery.
