Infectious Diseases in Critical Care Jordi Rello, Martin H. Kollef, Emilio Díaz, Alejandro Rodríguez, 2010-05-28 Infections and their complications are a very important clinical area in the intensive care unit setting. Community-acquired infections and nosocomial infections both contribute to the high level of disease acquisition common among critically ill patients. The accurate diagnosis of nosocomial infections and the provision of appropriate therapies, including antimicrobial therapy effective against the identified agents of infection, have been shown to be important determinants of patient outcome. Critical care practitioners are in a unique position in dealing with infectious diseases. They are often the initial providers of care to seriously ill patients with infections. Additionally, they have a responsibility to ensure that nosocomial infections are prevented and that antimicrobial resistance is minimized by prudently employing antibiotic agents. It is the editors' hope that this book will provide clinicians practicing in the intensive care unit with a reference to help guide their care of infected patients. To that end they have brought together a group of international authors to address important topics related to infectious diseases for the critical care practitioner.

What to know about Antigenic Shift and Drift. A Concise Review. Dr. Hakim. K. Saboowala, 2021-10-11 What to know about Antigenic Shift and Drift. A Concise Review. As part of the host-pathogen arms race, viruses are continually evolving to evade the host immune response, be it from previous infection or immunity acquired through vaccination. Many people get their annual flu shots in the hope it will protect them from that year's seasonal flu outbreaks. However, there is no guarantee that the strains predicted to be circulating that year will actually be the ones that do. Even with careful research and probability modelling, a certain amount of educated guesswork is involved for manufacturers who select strains to incorporate into the annual vaccine. And the main culprits for their headaches? Antigenic drift (A process by which inaccurate viral RNA polymerase frequently produces point mutations in certain error-prone regions in the genes.) and Antigenic shift (It is less frequent than antigenic drift. Thus an effort has been made in this Booklet to describe these culprits for enthusiastic medicos comprehensively along with plenty of relevant Illustrations for their better understanding. ...Dr. H.
