Compendio de enzimología BATTANER ARIAS, Enrique,2014-02-24 Si algo distingue realmente a la Bioquímica del resto de las disciplinas químicas, es el papel central que en los seres vivos desempeñan las enzimas. Y si algún elemento distintivo hay en la Bioquímica frente a las ciencias biológicas es que las enzimas nos brindan un modelo interpretativo de uso general para todas ellas sin excepción en términos de la teoría atómico-molecular. El estudio de las biomoléculas no es en sí mismo más que una serie de capítulos de la Química Orgánica, por más que se utilicen técnicas poco convencionales desde el punto de vista de esta ciencia. Lo realmente único en la química biológica es esa impresionante cantidad de catalizadores específicos encargados cada uno de un determinado proceso dentro de los muchos miles de reacciones químicas posibles en los organismos. ¿Cómo son las enzimas? ¿Cómo funcionan? ¿Cómo se forman? La respuesta a estas preguntas, entendidas en su más amplio significado, nos brindaría la explicación a todos los fenómenos que asociamos a la vida: la posibilidad de un metabolismo; de su regulación, y por tanto de su integración a un nivel fisiológico; igualmente, de su biosíntesis y todos los fenómenos genéticos a ella asociados; y por último, de las complicadas pautas evolutivas y adaptativas de los organismos vivientes.

Las enzimas Francisco J. Plou, 2016-03-10 Miles de reacciones químicas tienen lugar en nuestro organismo en cada instante. La mayoría de ellas depende de unas proteínas que actúan como catalizadores, que aceleran millones de veces los procesos que ocurren en los seres vivos; sin ellas, la vida no sería posible. Estas moléculas son las enzimas, que al operar en condiciones experimentales suaves, se han convertido en pilares esenciales para la sostenibilidad de muchos procesos industriales. El ser humano ha aprovechado el enorme potencial de estos catalizadores biológicos y los produce a gran escala a partir de cultivos de microorganismos para incorporarlos a muchas de nuestras actividades cotidianas: para obtener alimentos saludables (productos sin lactosa, grasa de cacao, zumos, etc.), biocombustibles y polímeros, producir detergentes, tratar prendas textiles, en la producción de antibióticos o incluso en el tratamiento de enfermedades genéticas o en análisis clínicos.

Enzimología Ignacio Núñez de Castro, 2001 El siglo XXI comienza bajo la nueva revolución biotecnológica. Cuando está terminando la etapa del genoma, de nuevo las proteínas toman el protagonismo en la era del proteoma. Entre las proteínas, las enzimas —se les ha llamado también los «agentes de la vida»— son las encargadas de catalizar las reacciones que tienen lugar en los organismos vivos. Se recogen en ella los tópicos clásicos de la energética y de la cinética enzimática y su regulación, tanto por cambios conformacionales de la estructura de la proteína como por los que suponen una modificación covalente. Se incorporan, asimismo, unos capítulos sobre temas más recientes, como son la introducción al análisis de control de flujo, el análisis enzimático y el estudio de ribozimas, abzymas y enzimas artificiales. El texto es claro y sencillo a la vez que riguroso. Pensando siempre en el alumno, el autor, con larga experiencia en la docencia de la Enzimología, realiza un desarrollo lógico y gradual de los temas analizando paso a paso el desarrollo matemático de las ecuaciones cinéticas que describen el comportamiento de las enzimas, para facilitar su comprensión.
