**Unexpected Challenges in Vascular Surgery** Alain Branchereau, Michael Jacobs, 2008-04-15 Despite accurate preoperative assessment and adequate preparation, unexpected, and sometimes disastrous, situations can occur during vascular and endovascular procedures. This latest book in the European Vascular Course series provides vascular and endovascular surgeons with the skills and techniques needed to solve these unforeseen intraoperative complications. It includes thirteen chapters on aortic neck problems during open and endovascular repair, ruptured clamp sites, ureteral lesions, unintentional covering of side branches, totally calcified aorta and embolization. Accidental conditions during carotid and lower limb revascularization are also covered in six chapters and additional challenges are described in another seven chapters.

**Sildenafil** Udo Dunzendorfer, 2012-12-06 This drug is a landmark discovery, which consequently has become the definitive therapy for the treatment of erectile dysfunction (ED). Following the major breakthrough in the field of nitric oxide (NO)-physiology and pharmacology leading to sildenafil being marketed, the most current information is presented in this reference book, including ongoing research from several disparate groups about NO as endothelium-derived relaxing factor (EDRF) and also as a neurotransmitter for nerves innervating erectile tissue in mammals. The development of sildenafil as an oral phosphodiesterase-5 (PDE5) inhibitor drug for the treatment of ED resulted in one of the first products, which made its way successfully from basic NO research to routine clinical therapy. This volume addresses all fields of sildenafil application in both men and women. In a highly competitive research environment with a critical medical need for drug improvements the reader will learn more about clinical resistance to sildenafil treatment and the modalities to overcome the failure rates. The individual chapters cover clinical use, pharmacokinetics, pharmacodynamics, biochemistry, and cultural aspects. They

are written by leading experts in their respective fields. Therefore, readers – whether professionals in the pharmaceutical industry, physicians treating ED, biochemists, chemists or pharmacologists – will find a detailed and up-to-date knowledge base about current research activities and an excellent overview for further research on this compound class and its cultural impact.

*Language Comprehension and Production in Normally Developing Children and Children with Language Impairment* Maria Cristina Saccuman,2005 Evidence from brain imaging studies has demonstrated that changes in the behavioral profiles during late childhood are mirrored by continuing development and reorganization in brain morphology and

physiology. However, very little is known about the development of functional organization underlying cognitive processes such as language. Even less is known about the physiological underpinnings of atypical language development, such as that seen with language impairment (LI), a condition defined as a delay or abnormality in expressive and/or receptive language skills in the absence of frank neurologic impairment, mental retardation, hearing loss, autism or social or emotional problems. Although a number of anatomical and functional abnormalities have been detected in the LI population, the functional neural patterns that underlie language processing in LI have not been described. In two sets of experiments, we used functional magnetic resonance imaging to explore brain activity in school-age children, with and without LI, and young adults, engaged in two tasks: (1) picture naming (PN) and (2) comprehension of sentences of increasing syntactic complexity (CSI). Two approaches were adopted to analyze the data: whole-brain group analysis with normalization to the Talairach template, and a region-of-interest (ROI) analysis, with each region traced on the individual subject's reconstructed cortical surface. Typically-developing children were as accurate as adults on picture naming, but significantly slower. On CSI, they were as fast as adults, but less accurate. Activation patterns were similar for the two groups, and compatible with the literature. However, numerous developmental and task-related differences in the activations were observed. For Picture Naming, children recruited frontal and parietal networks involved in lexical retrieval less than adults did. For CSI, we found more occipito-parietal activation in adults, and more frontal and temporal involvement for children. We suggest that interactions between maturational and strategic differences underlie developmental changes in functional patterns. Compared to typically-developing children, children with LI showed reduced but not divergent activation patterns, with consistent signal reduction in frontal, temporal, and parietal regions. Children with LI showed significantly more deactivations than controls in superior-frontal and middle-frontal gyri, inferior parietal lobule and precuneus. Our findings support a resource limitation account of LI.

*Embodiment and the Neural Correlates of Gestures and Word Meanings* Analía L Arévalo, 2006 The overarching goal of this work is to understand the brain's organization for meaning (linguistic and non-linguistic). Our group began to investigate this question by comparing noun and verb processing, following previous research showing distinctions in the way these two word categories are processed across different populations and languages. In the brain-injury literature, classic aphasia theories contend that patients show differential abilities on noun vs. verb processing, resulting in a noun-verb double-dissociation between patient groups. In addition, studies using various neuroimaging techniques have suggested the involvement of different neural areas and/or networks in noun vs. verb retrieval, with the left frontal lobe being especially crucial for verb processing. However, neither imaging nor clinical results are consistent, and to date, no unified theory can account for the various findings reported in the literature. Leading theories on how word types dissociate from each other

include distinctions at the lexical level, correlations between featural properties, and distinct sensorimotor representations. Recent theories on embodied cognition have suggested that processing such stimuli involves imagery of the different body parts associated with a given concept, with activity in the sensorimotor areas along the cortex corresponding to those body parts. In my dissertation work, I implemented psycholinguistic and neuroimaging techniques to systematically test these putative distinctions. Our noun-verb stimuli were tested behaviorally on healthy and aphasic participants and in an fMRI paradigm on healthy participants who were native speakers of two structurally diverse languages: English and Italian. The noun-verb distinction was consistent across healthy and patient groups and we found no convincing evidence for the classic double-dissociation. The hand imagery data, on the other hand, revealed an unexpected double-dissociation between patient and control performance, suggesting this dimension may play an important role in the process of meaning organization. These results represent a first step in the systematic testing of two major views on the mental organization for meaning. With new behavioral and imaging studies on the way targeting these distinctions directly, we hope to reveal a clearer picture of semantic organization and breakdown, bringing us one step forward in our understanding of how the brain organizes meaning.
