Comparison Study of Riverbed and Cisco Packet Tracer for Networks Building Bilal Ahmad Hamasaeed,2019 Simulators are a very beneficial networking tool in networking field. Deploying the network model without being tested through one of the network simulators won't guarantee the success of the project during the implementation and the outcomes could be unpredictable. For all practical purposes, network simulators are used to have more chance of success of applying network architecture in the real workplaces without failure. With the network simulators, the devices of the network are connected to one another, After that, they all be configured, then the implementation of the topology can guaranty of the success of the project as the topology has been tested previously. As the real work is started after using more accurate simulator and advanced one, and the plan of the network from a softcopy was converted to the physical one - real world with more certainty of success and less failure percentage of failing the project, the implementation of the network topology could be easier and increase the success rate of any project compare to deploying a network topology without bring it through simulations process. This research work provides a comparison between two of the most common network simulators (Cisco packet tracer and Riverbed) by simulating an identical topology for both and to choose the practical software to be used for the network lectures of students, and even for the industrial use according to some quality criterial analysis and technical differences.
