Surface Engineering for Corrosion and Wear Resistance J. R. Davis, 2001-01-01 Engineers are faced with a bewildering array of choices when selecting a surface treatment for a specific corrosion or wear application. This book provides practical information to help them select the best possible treatment. An entire chapter is devoted to process comparisons, and dozens of useful tables and figures compare surface treatment thickness and hardness ranges; abrasion and corrosion resistance; processing time, temperature, and pressure; costs; distortion tendencies; and other critical process factors and coating characteristics. The chapter Practical Guidelines for Surface Engin.

What's New in Phosphate Coating of Steel Henry A. Kafarski, Society of Automotive Engineers, 1966

Phosphate Coatings Suitable for Personal Protective Equipment Diana Petronela BURDUHOS-NEGRIS, Costica BEJINARIU, Andrei Victor SANDU, 2021-02-05 Phosphate coatings can improve the corrosion resistance of carbon steel equipment such as carabiners. The specific porosity of the phosphate layer allows the deposition of an elastomer-based paint for absorbing mechanical shocks. The book is relevant for fundamental and applied research in the field of protective phosphate layers and their industrial applications. It also describes how to design and develop phosphating solutions that differ in the type and concentration of metal ions dissolved in phosphoric acid. Keywords: Safety Rings, Carabiners, Phosphate Coatings, Aluminum Alloys, Carbon Steels, Stainless Steels, Structural Characterization, Mechanical Characterization, Corrosion Resistance, Friction Coefficient, Temperature Shock, Mechanical Impact, Design of Carabiners, Coating Technology.

Phosphate Surface Treatments on Steel Max Kronstein,NEW YORK UNIV NY COLL OF ENGINEERING.,1954 A review of U.S. Patent literature concerned with phosphate coating of metal summarizes 179 patents in the field, with special attention given to the time factor, temperature and recommended pH. A critical review of the classification of iron phosphate coating materials and zinc phosphate coating materials as pre-paint treatments, in respect to their chemical composition is given. Here, it is understood that iron phosphates might contain primarily alkali phosphates together with small amounts of metal ions derived from metals which can be defined as to their standing in certain specific ranges of the electromotive series. Zinc phosphates, also, can be produced in many different ways whereby, in reaction with steel surfaces, iron ions will participate in the reaction of the bath and in the formation of the coating on the steel. It was found to be typical for metal phosphates high in zinc content to form a medium coating weight during the first 60 sec. of spray application. Between 60 sec. and 120 sec. spray-time, the coating weight increases rapidly to and above 150 mg/per sq. ft. Metal phosphates which are low in zinc content and are classified as iron phosphates, produce a medium coating weight during the first 120 sec. of spray-time. The coating weight does not increase considerably with longer spray-time.
