Arguments that Count Rebecca Slayton,2023-10-31 How differing assessments of risk by physicists and computer scientists have influenced public debate over nuclear defense. In a rapidly changing world, we rely upon experts to assess the promise and risks of new technology. But how do these experts make sense of a highly uncertain future? In Arguments that Count, Rebecca Slayton offers an important new perspective. Drawing on new historical documents and interviews as well as perspectives in science and technology studies, she provides an original account of how scientists came to terms with the unprecedented threat of nuclear-armed intercontinental ballistic missiles (ICBMs). She compares how two different professional communities—physicists and computer scientists—constructed arguments about the risks of missile defense, and how these arguments changed over time. Slayton shows that our understanding of technological risks is shaped by disciplinary repertoires—the codified knowledge and mathematical rules that experts use to frame new challenges. And, significantly, a new repertoire can bring long-neglected risks into clear view. In the 1950s, scientists recognized that high-speed computers would be needed to cope with the unprecedented speed of ICBMs. But the nation's elite science advisors had no way to analyze the risks of computers so used physics to assess what they could: radar and missile performance. Only decades later, after establishing computing as a science, were advisors able to analyze authoritatively the risks associated with complex software—most notably, the risk of a catastrophic failure. As we continue to confront new threats, including that of cyber attack, Slayton offers valuable insight into how different kinds of expertise can limit or expand our capacity to address novel technological risks.

**Mastering the Travel Intermediaries** Ben Vinod,2024-06-25 This book chronicles the role of travel intermediaries: global distribution systems (GDS), travel management companies (TMC), and online travel agencies (OTA) in the distribution of travel products. The book covers the historical development of these intermediaries and explores their current state and future prospects. Almost six decades after the introduction of computerized reservations systems and four decades after the

introduction of Global Distribution Systems that allowed travel agents to make automated airline bookings, the distribution of air products is amid a major transition. A fundamental change is pricing power, which shifts from the GDSs to the airlines for the indirect channel. These changes are driven by advancements in technology, market economics, and airline cost controls, leading to the emergence of new revenue models that will permanently alter the landscape of air distribution. As a result, travel intermediaries are experiencing the effects of these turbulenttimes and must adopt innovative approaches and initiatives to adapt and transform their business models rather than maintaining the status quo. In addition to the ongoing transformation, over the next decade, the advancements in emerging technologies like blockchain and decentralized digital identity will further revolutionize the distribution landscape across all sectors of the travel industry.

**Management Information Systems** David Lee Anderson,2000 This text uses cases to explain Management Information Systems concepts within an industry perspective. The cases are direct, real and written in the late '90's. Each chapter contains specific sections to thoroughly present and explain the relevant information systems and business concepts. Built upon extensive information technology sections, this text includes contextual elements such as actual financial information and analysis, the importance of data and the impact of technology on the manufacturing, marketing and distribution

processes. An appropriate text for Management Information Systems.

Air Force Command and Control Information Processing in the 1980s Donald W. Kosy,Rand Corporation,1974 Computer software is vitally important to today's command-control (CC) systems. 'Software' here refers to all the computer programs, and their associated documentation, that give purpose and direction to computer hardware, tailoring it to serve the information needs of a user and help him make decisions. This report forecasts the characteristics and capabilities of software technology likely to be available in the 1980s for use in Air Force CC system applications. It also compares estimates of future CC requirements with projections of software technology, points out gaps between the technology necessary and that likely to be available, and outlines R+D strategies to overcome these deficiencies.
