*The Chelation Controversy* Gregory Pouls, Maile Pouls, 2005 Safely Rid Your Body of Stored Chemicals and Heavy Metals If you live in this modern world of ours, your body is being exposed to oxidizing chemicals and heavy metals such as aluminum, arsenic, cadmium, and lead on a daily basis. When your body starts accumulating toxins faster than it can eliminate them, it begins to store them in your tissues. These stored toxins initiate degenerative processes in your body that can lead to diseases such as cancer, heart disease, and arthritis. Chelating agents--substances that latch on to and carry toxins out of the body--can help you free yourself of this destructive load. In *The Chelation Controversy*, Drs. Gregory and Maile Pouls discuss the use of chelating agents, including those taken orally and those given intravenously. The authors also familiarize you with some of the controversy surrounding chelation therapy. In addition to a comprehensive guide to the big six heavy metals and a discussion on the harmful effects of oxidation, the authors cover the most common prescription IV and oral chelating agents. They also provide guidance on what to look for in an oral chelation formula and describe the nutritional substances and antioxidants that can support your detoxification efforts. If your exposure to toxins is higher than average or if you simply want to preserve, maintain, support, and enhance your health, energy, and vitality in this toxic world, *The Chelation Controversy* provides the information you need to put this therapy to work for you.

**Novel Chemical, Microbiological and Physical Approaches In Food Safety Control, volume II** Marco Iammarino, Sara Panseri, Gulhan Unlu, Speranza Barbara, Antonio Bevilacqua, Rosalia Zianni, 2024-11-21 One of the most important emerging aspects that requires further research in food safety is the simultaneous presence of different contaminants (both microbiological and chemical) in the same food, the so-called “cocktail effect”. Large amounts of data are needed for these evaluations, since the huge number of interactions among different contaminants, which maybe hypothesized, have to be statistically evaluated before confirming an effective risk. Moreover, the range of food to take into account within these studies is very wide. In order to obtain comprehensive datasets, new approaches are needed. These approaches, composed of new analytical procedures, microbiological protocols and chemical/physical determinations, should allow the quick and economic obtainment of many parameters, possibly respecting the environment, in the “green chemistry” perspective.
