An Examination of Romantic Relationship Initiation Strategies Utilized by Young Adults with High-functioning Autism Or Asperger's Syndrome Aaron Loewy, 2021 Individuals with and without High-Functioning Autism and Asperger's Syndrome (HFA/AS) both show interest in sexuality and/or romance. However, the symptoms of autism, such as difficulties with indirect communication, emotional expression, signaling, theory of mind, and sexuality, can elicit difficulties that make the establishment and maintenance of romances problematic. Despite these challenges, many individuals on the spectrum have reported romantic experiences. To gain a better understanding of how such individuals formed and sustained romantic relationships, seven participants with HFA/AS were interviewed using a semi-structured approach followed by a thematic analysis of their transcribed responses. It was found that common circumstances served to catalyze the relationship-formation process resulting in initiation despite in socialization ability. Once a romantic relationship was established, having a supportive partner was found to be instrumental in its maintenance.

Functional Behavior Assessment for People with Autism Beth A. Glasberg, 2006 Describes functional behaviour assessment (FBA), which is a strategy that parents and professionals can use to identify the factors contributing to problem behaviour. Understanding Romantically Intimate Relational Escalation and De-escalation Among High Functioning Individuals Possessing an Autism Spectrum Disorder Michael Montpetit, 2016 Romantic relationships are an important aspect of anyone's life. For individuals with an autism spectrum disorder, this is true as well. However, these people may experience relational dynamics and trajectories that are in some aspects either similar to or markedly different from those who are not on the spectrum. There are very few studies analyzing and understanding how adults with an ASD navigate romantic relationships. This particular study examined how turning points pertaining to relational escalation or de-escalation were recognized and understood by eight individuals (four men and four women) possessing an ASD. The Retrospective Interview Technique (RIT) was implemented in order to accrue data from participants. Each participant completed a RIT graph mapping out a romantic relationship of their choice by understanding when a turning point was identified and placing a mark next to the corresponding level of relational closeness or attachment. Once all turning points were mapped out, they were connected with lines so that a visual representation of the entire relationship may be viewed. Participants were then queried about how they knew that particular event (or mark) to be a turning point, how it impacted the relationship, and how they were, personally, influenced by it (how they responded to the event). Interviews were transcribed and explored through a grounded theory approach. Specifically, Braun and Clarke's thematic analysis method was applied to articulate interview data. The research revealed four main themes (Relational Genesis, Relational Escalation, Relational De-escalation and Conflict Management) as well as seventeen sub themes. Limitations for this study, information relating to discourses surrounding autism spectrum disorders and romantically intimate relationships, as well as, areas for future study are also discussed.

The Intricacies of Dating on the Autism Spectrum Alexandra Raphaela Arena, 2019 There is a general agreement that individuals with high-functioning autism (HFA) struggle with social skills, but the extent to which this affects their dating

lives needs further exploration. This research study sought to answer two research questions: (a) What are the perspectives of individuals with HFA as they navigate both the formation of and commitment to romantic relationships? (b) How do my experiences as a speech language pathologist (SLP) and behavior analyst working with individuals with Autism spectrum disorder (ASD) influence my perception of the difficulties individuals with HFA face while navigating and forming romantic relationships? The literature review revealed that individuals with HFA are highly interested in romantic relationships but do not feel they have the skills to initiate and maintain romantic relationships. This study presents a qualitative case study that also employs autoethnographic methods via focus groups, field notes, and a journal reflection. The analysis examined what individuals with HFA believe their challenges with dating are and identified ways to incorporate client-centered practice to address these difficulties. I maintained a journal throughout the research process to identify any biases. This study is rooted in a deep understanding of the socio-political model of disability. Data analysis revealed the following themes: self-management campaigns, I'm different than you are, and anxiety which are explained in detail throughout the study. Through this study, it is suggested that future research and practice includes the creation of therapeutic interventions and social supports aimed at decreasing the mental health risk in the lives of those with HFA.

Romantic Relationships of Individuals with Autism Spectrum Disorders Compared to Romantic Relationships of Individuals with Neurotypical Development Amanda Molinari, 2016 The purpose of this study was to explore the ways in which young adults with autism spectrum disorder (ASD) establish and maintain romantic relationships. The data were collected through semi-structured interviews by three participants diagnosed with high-functioning ASD or Aspergers Syndrome. Participants reported difficulties in initiating relationships, resolving conflicts when in relationships, and terminating relationships because of their deficits in social and communication skills due to their ASD diagnosis. Results indicated a need for continued research to develop evidence-based treatment approaches to support young adults with ASD to develop and maintain healthy and successful romantic relationships.

Obsessive-compulsive Disorder Mitzi Waltz, 2000 Obsessive-compulsive disorder (OCD) is one of the most common psychiatric problems faced by children, although frequently not diagnosed or treated. Many children diagnosed with OCD also turn out to have other brain-based disorders, particularly ADD/ADHD. Childhood OCD can be a truly debilitating disability, not just a minor problem or personality quirk. Children with OCD experience extreme anxiety and embarrassment. Their OCD symptoms often prevent them from building good relationships, from achieving their best in school, and from

having a normal childhood. The effects of this disruption can be painful and lifelong. The good news is that OCD is very treatable. Obsessive-Compulsive Disorder helps parents: Secure a diagnosis Manage family life Understand medical interventions Explore therapeutic and other interventions Get care with an existing health plan, even with no coverage of mental disorders Author Mitzi Waltz, an advocate for children's neurological issues, has included the stories of dozens of parents and adolescents
