Planning, Measurement and Control for Building Robert Cooke,2009-09-28 Planning, Measurement and Control for Building is a companion to Building in the 21st Century, providing an up-to-date and easy to read overview of the processes by which building projects are planned, their costs and materials estimated and the building work controlled – the 'paperwork side' of construction. Students on National Award, Certificate or Diploma courses in Construction will find this volume very useful as they study for the measurement, planning, building control and technology units of those courses. With many colour photographs and diagrams, the book focuses on construction as a team effort and shows how various elements of design, estimating, tendering, and building contracts combine to enable these teams to work together to plan and organise construction projects that meet the needs of clients. The book covers a range of relevant topics in some detail, for example the basics of 'taking off' and the use of 'dim' paper, the building regulations and surveying processes. Common terms and abbreviations are explained and put into context throughout the book. The coverage is completed by discussing three very different projects, including inception to topping out of a prestigious office development, illustrating how all of the technical aspects of design and legislation are put into place on real projects.

Managing Measurement Risk in Building and Civil Engineering Peter Williams, 2015-11-16 Measurement in civil engineering and building is a core skill and the means by which an architectural or engineering design may be modelled financially, providing the framework to control and realise designs within defined cost parameters, to the satisfaction of the client. Measurement has a particular skill base, but it is elevated to an 'art' because the quantity surveyor is frequently called upon to interpret incomplete designs in order to determine the intentions of the designer so that contractors may be fully informed when compiling their tenders. Managing Measurement Risk in Building and Civil Engineering will help all those who use measurement in their work or deal with the output from the measurement process, to understand not only the 'ins and outs' of measuring construction work but also the relationship that measurement has with contracts, procurement, claims and post-contract control in construction. The book is for quantity surveyors, engineers and building surveyors but also for site engineers required to record and measure events on site with a view to establishing entitlement to variations, extras and contractual claims. The book focuses on the various practical uses of measurement in a day-to-day construction context and provides guidance on how to apply quantity surveying conventions in the many different circumstances encountered in practice. A strong emphasis is placed on measurement in a risk management context as opposed to simply 'taking-off' quantities. It also explains how to use the various standard methods of measurement in a practical working environment and links methods of measurement with conditions of contract, encompassing the contractual issues connected with a variety of procurement methodologies. At the same time, the many uses and applications of measurement are recognised in both a main contractor and subcontractor context. Measurement has moved into a new and exciting era of on-screen quantification and BIM models but this has changed nothing in terms of the basic principles underlying measurement: thoroughness, attention to detail, good organisation, making work auditable and, above all, understanding the way building and engineering projects are designed and built. This book will help to give you the confidence to both 'measure' and

understand measurement risk issues by: presenting the subject of measurement in a modern context with a risk management emphasis recognising the interrelationship of measurement with contractual issues including identification of pre- and post-contract measurement risk issues emphasising the role of measurement in the entirety of the contracting process particularly considering measurement risk implications of both formal and informal tender documentation and common methods of procurement conveying the basic principles of measurement and putting them in an IT context incorporating detailed coverage of NRM1 and NRM2, CESMM4, Manual of Contract Documents for Highway Works and POM(I), including a comparison of NRM2 with SMM7 and a detailed analysis of changes from CESMM3 to CESMM4 discussing the measurement implications of major main and sub-contract conditions (JCT, NEC3, Infrastructure Conditions and FIDIC) providing detailed worked examples and explanations of computer-based measurement using a variety of industry-standard software packages
