*Psychological Assessment of Spinal Cord Stimulator Candidates: Predicting Long-term Post-surgical Pain* Lekeisha A. Sumner, 2006 There is a demonstrated link in the research literature between (a) psychological factors and neuromodulation outcomes, and (b) marital/intimate support and surgical outcomes. One such neuromodulation therapy, spinal cord stimulation (SCS), is becoming increasingly popular and is the focus of much clinical and research attention due to highly variable patient outcomes. Prior research on SCS provides sparse and conflicting evidence that psychological factors

Specifically, using pain intensity as the dependent measure, it was hypothesized that psychological factors assessed pre-operatively would predict postsurgical pain based on time course. Data are presented for 58 patients with chronic, intractable pain who were recruited from a large midwestern university hospital. All patients underwent permanent placement of SCS after undergoing a psychological assessment that included: a clinical interview and administration of a battery of standardized measures (Minnesota Multiphasic Personality Inventory-2, Beck Depression Inventory, Multidimensional Pain Inventory, State-Trait Anxiety Inventory, Coping Strategies Questionnaire). As determined by a multivariate model, significant associations (P
