Simulating Information Retrieval Test Collections David Hawking,Bodo Billerbeck,Paul Thomas,Nick Craswell,2022-06-01
Simulated test collections may find application in situations where real datasets cannot easily be accessed due to confidentiality concerns or practical inconvenience. They can potentially support Information Retrieval (IR) experimentation, tuning, validation, performance prediction, and hardware sizing. Naturally, the accuracy and usefulness of results obtained from a simulation depend upon the fidelity and generality of the models which underpin it. The fidelity of emulation of a real corpus is likely to be limited by the requirement that confidential information in the real corpus should not be able to be extracted from the emulated version. We present a range of methods exploring trade-offs between emulation fidelity and degree of preservation of privacy. We present three different simple types of text generator which work at a micro level: Markov models, neural net models, and substitution ciphers. We also describe macro level methods where we can engineer macro properties of a corpus, giving a range of models for each of the salient properties: document length distribution, word frequency distribution (for independent and non-independent cases), word length and textual representation, and corpus growth. We present results of emulating existing corpora and for scaling up corpora by two orders of magnitude. We show that simulated collections generated with relatively simple methods are suitable for some purposes and can be generated very quickly. Indeed it may sometimes be feasible to embed a simple lightweight corpus generator into an indexer for the purpose of efficiency studies. Naturally, a corpus of artificial text cannot support IR experimentation in the absence of a set of compatible queries. We discuss and experiment with published methods for query generation and query log emulation. We present a proof-of-the-pudding study in which we observe the predictive accuracy of efficiency and effectiveness results obtained on emulated versions of TREC corpora. The study includes three open-source retrieval systems and several TREC datasets. There is a trade-off between confidentiality and prediction accuracy and there are interesting interactions between retrieval systems and datasets. Our tentative conclusion is that there are emulation methods which achieve useful prediction accuracy while providing a level of confidentiality adequate for many applications. Many of the methods described here have been implemented in the open source project SynthaCorpus, accessible at: <https://bitbucket.org/davidhawking/synthacorpora/>

How John Wrote the Book of Revelation: From Concept to Publication Kim Mark Lewis, 2015-11-22 How John Wrote the Book of Revelation is the first of its kind, and introduces genetic literary reconstruction to Biblical studies. It enables the reader to produce prior drafts of Hebrew and Christian Scriptures, thereby allowing the reader to apply the literary science of genetic criticism to a book in the Bible. How John Wrote the Book of Revelation takes the most difficult book to understand in the Christian Scriptures and reveals the sequence in which it was written, from the very first line to the final parallel. This provides the reader, for the first time, with the experience of observing how a Biblical book was written, and does this from an intimate perspective, as though they were looking over John's shoulders as he crafted it. How John Wrote the Book of Revelation is the first book that teaches the reader how to read Revelation the way it was written. After centuries of blind guess work trying to divine meaning, and weak interpretations of symbols, this book finally presents a clear, precise, and consistent method. It is a guidebook to identify all the rich symbols and their meanings within Revelation. Inside the pages of this book is the all-encompassing theory of construction for the book of Revelation. It includes three prior drafts of the book of Revelation, along with hundreds of charts and illustrations. How John Wrote the Book of Revelation is like no other book that has been written before, and sets a new paradigm for all Biblical works.

Application of Image Processing and Knowledge Reasoning in the Construction of New Power System Fuqi Ma, Bo Wang, Hengrui Ma, Yikui Liu, Rong Jia, 2025-03-12 The power system is undergoing changes in terms of grid formation, technology foundation, and operational characteristics, which are placing higher requirements on the perception and cognitive capabilities of the current system. This necessitates the urgent promotion of new power systems construction, incorporating digital and intelligent technologies to serve the energy transformation. AI plays a crucial role as one of the key driving technologies for the digital transformation of energy. It encompasses an exclusive AI formed by the fusion of relevant theories, technologies, and methods of AI with the physical laws, technologies, and knowledge of power systems. From the

perspective of perception and cognition, the exclusive AI primarily consists of two research directions: 1) The application of perceptual intelligent technologies (such as image recognition) in scenarios like equipment defect recognition and construction site safety monitoring; 2) The application of cognitive intelligence technologies (such as knowledge question & answer and knowledge graph) in scenarios like power knowledge retrieval and intelligent question & answer. By leveraging power production knowledge and AI technology, intelligent perception and cognition of the operational status can effectively meet the urgent needs of the power industry development. This Research Topic focuses on the application of image processing and knowledge reasoning in the power industry. It utilizes multi-source power industry image data, employing image intelligent processing, deep semantic knowledge mining, and other technical methods to achieve intelligent perception and cognition of the power system's operation status. The goal of this Research Topic is to enhance the digital and intelligent level of the power system and propel the construction and development of the new power system to a new level.
