Chlorinated Drinking-water, Chlorination By-products IARC Working Group on the Evaluation of Carcinogenic Risks to Humans, 1991 Evaluates the carcinogenic risk to humans posed by the consumption of chlorinated drinking-water by two chemicals used in the chlorination of drinking-water by a number of halogenated by-products formed when chlorine interacts with organic matter in water and by a selection of other halogenated compounds found in drinking-water. Chlorination was selected for evaluation because of its widespread use and because potentially carcinogenic by-products have been measured in chlorinated water. The book also includes a separate monograph on cobalt and cobalt compounds. The volume opens with a discussion of the many methodological problems that complicate efforts to assess the carcinogenicity of chlorinated water. Against this background the book evaluates the design and findings of all studies relevant to the carcinogenicity assessment

of chlorinated drinking-water two chemicals (sodium chlorite and hypochlorite salts) used in the chlorination of water eight of the by-products most frequently measured in drinking-water and three additional halogenated chemicals detected in drinking-water. Because of the formidable methodological obstacles faced by all investigations only one of these substances could be classified: bromodichloromethane was classified as possibly carcinogenic to humans. The final monograph considers data on metallic cobalt, cobalt alloys including cobalt-containing surgical implants and dental devices and cobalt compounds. In view of the strength of evidence linking cobalt metal powder and cobalt[II] oxide to cancer in experimental animals cobalt and cobalt compounds were classified as possibly carcinogenic to humans.

Chemical Information for Chemists Judith N Currano, Dana Roth, 2014-03-17 While it is not difficult to find data in many cases, what advice can you get on the quality of the data retrieved? Chemical Information for Chemists could help with this problem and more. This book is a chemical information book aimed specifically at practicing chemists. Written and edited by experts in the field, it is ideal for chemists who lack a chemical information professional able to teach basic and intermediate techniques in retrieving and evaluating information using the unique entry points of the chemical literature, including structure, formula, substructure, and sequence. Aimed at students on undergraduate and graduate courses, it could also be a useful guide to new information specialists who are facing the challenging diversity of chemical literature.

Dry Cleaning, Some Chlorinated Solvents and Other Industrial Chemicals IARC Working Group on the Evaluation of Carcinogenic Risks to Humans,International Agency for Research on Cancer,1995 Evaluates the carcinogenic risks to humans posed by exposures in the dry cleaning industry by eight chlorinated solvents and related chemicals and by an

additional group of seven industrial chemicals. Dry cleaning is evaluated in the first and most extensive monograph. Concerning exposures to specific chemicals, tetrachloroethylene is identified as the most commonly used solvent during the last two to three decades. The evaluation also considers exposure to the wide range of chemicals used in the treatment of spots. A review of epidemiological studies on dry cleaning indicates that the risks for cancers at two sites, urinary bladder and esophagus, may be increased by employment in dry cleaning. The monograph concludes that dry cleaning entails exposures that are possibly carcinogenic to humans. A second group of monographs evaluates selected chlorinated solvents and related chemicals used in dry cleaning, metal cleaning, and degreasing as chemical intermediates and in the production of insecticides and herbicides. Trichloroethylene, tetrachloroethylene, and 1,2,3-trichloropropane were classified as probably carcinogenic to humans. 1-Chloro-2-methylpropene was classified as possibly carcinogenic to humans. The remaining chemicals - chloral and chloral hydrate, dichloroacetic acid, trichloroacetic acid, and 3-chloro-2-methylpropene - could not be classified. For the remaining seven chemicals used in a diversity of industrial applications, vinyl fluoride was classified as probably carcinogenic to humans. Furan, benzofuran, and vinyl acetate were classified as possibly carcinogenic to humans. Acrolein, crotonaldehyde, and furfural could not be classified.
