Modelling of Multiphysics Systems Peeter Joot, This document is based on my lecture notes for the Fall 2014, University of Toronto Modeling of Multiphysics course (ECE1254H), taught by Professor P. Triverio. Official course description: "The course deals with the modeling and simulation of physical systems. It introduces the fundamental techniques to generate and solve the equations of a static or dynamic system. Special attention is devoted to complexity issues and to model order reduction methods, presented as a systematic way to simulate highly-complex systems with acceptable computational cost. Examples from multiple disciplines are considered, including electrical/electromagnetic engineering, structural mechanics, fluid-dynamics. Students are encouraged to work on a project related to their own research interests." Topics: • Automatic generation of system equations (Tableau method, modified nodal analysis). • Solution of linear and nonlinear systems (LU decomposition, conjugate gradient method, sparse systems, Newton-Raphson method). • Solution of dynamical systems (Euler and trapezoidal rule, accuracy, stability). • Model order reduction of linear systems (proper orthogonal decomposition, Krylov methods, truncated balanced realization, stability/dissipativity enforcement). • Modeling from experimental data (system identification, the Vector Fitting algorithm, enforcement of stability and dissipativity).

Compiler Techniques for MATLAB Programs Luiz Antonio De Rose,University of Illinois at Urbana-Champaign. Department of Computer Science,1996 Abstract: This thesis addresses the issues of translating an interactive array language, such as MATLAB , into a traditional compiled language, such as Fortran, in order to achieve better perfomance. It describes the main techniques, developed for our MATLAB-to-Fortran 90 compiler, to extract information from the high-level semantics of MATLAB for the generation of high-performance code. To perform the translation, an inference mechanism is necessary to generate the declarations for a typed language, to select the appropriate functions and operations, and to

allocate the necessary space. The inference mechanism developed for this MATLAB-to-Fortran 90 compiler combines static and dynamic inference methods for intrinsic type, shape, rank, and structural inference. This inference is enhanced with value propagation and symbolic-dimension propagation analyses. The experimental results, which compare compiled generated programs with the corresponding interpreted MATLAB execution, show that the compiler can generate code that performs more than 1000 times faster than MATLAB on an SGI Power Challenge, and as fast as the corresponding hand-written Fortran 90 programs. When compared with the performance of C-MEX files generated by the MathWorks MATLAB compiler, we observed that, for our tests, the Fortran 90 programs ran faster than the corresponding C-MEX programs on an SGI Power Challenge and on a Sun SPARCstation 10. This better perfomance is mainly attributed to our enhanced inference mechanism.

Engineering Design via Surrogate Modelling Alexander Forrester,András Sobester,Andy Keane,2008-09-15 Surrogate models expedite the search for promising designs by standing in for expensive design evaluations or simulations. They provide a global model of some metric of a design (such as weight, aerodynamic drag, cost, etc.), which can then be optimized efficiently. Engineering Design via Surrogate Modelling is a self-contained guide to surrogate models and their use in engineering design. The fundamentals of building, selecting, validating, searching and refining a surrogate are presented in a manner accessible to novices in the field. Figures are used liberally to explain the key concepts and clearly show the differences between the various techniques, as well as to emphasize the intuitive nature of the conceptual and mathematical reasoning behind them. More advanced and recent concepts are each presented in stand-alone chapters, allowing the reader to concentrate on material pertinent to their current design problem, and concepts are clearly demonstrated using simple design problems. This collection of advanced concepts (visualization, constraint handling, coping with noisy data, gradient-enhanced modelling, multi-fidelity analysis and multiple objectives) represents an invaluable reference manual for engineers and researchers active in the area. Engineering Design via Surrogate Modelling is complemented by a suite of Matlab codes, allowing the reader to apply all the techniques presented to their own design problems. By applying statistical modelling to engineering design, this book bridges the wide gap between the engineering and statistics communities. It will appeal to postgraduates and researchers across the academic engineering design community as well as practising design engineers. Provides an inclusive and practical guide to using surrogates in engineering design. Presents the fundamentals of building, selecting, validating, searching and refining a surrogate model. Guides the reader through the practical implementation of a surrogate-based design process using a set of case studies from real engineering design challenges. A Gentle Introduction to Scientific Computing Dan Stanescu,Long Lee,2022-05-01 Scientific Computation has established itself as a stand-alone area of knowledge at the borderline between computer science and applied mathematics.

Nonetheless, its interdisciplinary character cannot be denied: its methodologies are increasingly used in a wide variety of branches of science and engineering. A Gentle Introduction to Scientific Computing intends to serve a very broad audience of college students across a variety of disciplines. It aims to expose its readers to some of the basic tools and techniques used in computational science, with a view to helping them understand what happens behind the scenes when simple tools such as solving equations, plotting and interpolation are used. To make the book as practical as possible, the authors explore their subject both from a theoretical, mathematical perspective and from an implementation-driven, programming perspective. Features Middle-ground approach between theory and implementation. Suitable reading for a broad range of students in STEM disciplines. Could be used as the primary text for a first course in scientific computing. Introduces mathematics majors, without any prior computer science exposure, to numerical methods. All mathematical knowledge needed beyond Calculus (together with the most widely used Calculus notation and concepts) is introduced in the text to make it self-contained. The erratum document for A Gentle Introduction to Scientific Computing can be accessed here.

Implementing Models in Quantitative Finance: Methods and Cases Gianluca Fusai,Andrea Roncoroni,2007-12-20 This book puts numerical methods in action for the purpose of solving practical problems in quantitative finance. The first part develops a toolkit in numerical methods for finance. The second part proposes twenty self-contained cases covering model simulation, asset pricing and hedging, risk management, statistical estimation and model calibration. Each case develops a detailed solution to a concrete problem arising in applied financial management and guides the user towards a computer implementation. The appendices contain crash courses in VBA and Matlab programming languages.

Calculus for Cognitive Scientists James K. Peterson,2016-02-09 This book offers a self-study program on how mathematics, computer science and science can be profitably and seamlessly intertwined. This book focuses on two variable ODE models, both linear and nonlinear, and highlights theoretical and computational tools using MATLAB to explain their solutions. It also shows how to solve cable models using separation of variables and the Fourier Series.

[Dynamics and Control of Process Systems 2001 (DYCOPS-6)](#) George Stephanopoulos,Jay Hyung Lee,En Sup Yoon,2001 This Proceedings contains papers presented at the sixth IFAC Symposium on Dynamics and Control of Chemical Processes (DYCOPS 2001), which was held on Jejudo Island, Korea, on June 4-6, 2001. The triennial DYCOPS symposium is one of IFAC's highest-profile regular events, and has established an enviable reputation for quality. The reputation and coverage of DYCOPS ensures that these events always provide a comprehensive showcase of the best and latest research into all aspects of process control. DYCOPS-6 had as its theme Bridging Engineering with Science, and explored how the process control community should react to wider developments in chemical engineering research, where molecular-level phenomena and product design as related to materials and biotechnology are becoming increasingly important. Featuring papers by many of the world's leading experts in process control, the Proceedings of DYCOPS-6 form an indispensable resource for process control engineers and for chemical engineers seeking to understand the latest developments in chemical process control. Altogether over 100 papers are presented, on topics such as batch process control, model predictive control, control of distillation columns, fault detection, and many others.
