Manual of AIRBORNE TOPOGRAPHIC LIDAR Michael S Renslow,2025-02-21 Most geospatial practitioners agree that lidar (light detection and ranging) is the most significant mapping technology to emerge in the last several years. At first, processing lidar data to map the bare earth appeared to be the prime use of this technology, but having millions or billions of natively 3D, georeferenced points has fundamentally changed the perception of the service providers and the user community. Professionals in forestry, civil engineering, geology, geography, wetlands analysis, natural disaster response, flood plain mapping, and urban planning have embraced lidar as their data source of choice. The ASPRS Manual of Airborne Topographic Lidar covers all the relevant topics relating to the science behind lidar systems, mission planning, data collection and management, quality control/quality assurance, and product development. Selected topics are discussed in-depth for the Global Navigation Satellite System, Full Waveform Lidar, Digital Terrain Modeling using GIS, Rotary-Wing and Fixed-Wing Installations, Calibration, Flood Prone Area Mapping, Hydro-enforcement, Building Feature Extraction, Transportation Engineering, Natural Hazards Mapping, and Airport Surveying. Lidar experts from industry and academia have contributed to ten chapters and four appendices that serve as a reference book to document how this technology developed, and introduce new sensors and applications. There is emphasis on best practices and real-world solutions for the lidar data and product users. Also, since quality control and quality assurance are so critical to a successful data collection, processing, and validation, the reader will find several subchapters to support QA/QC throughout the Manual. New lidar technologies are presented for 3D Flash Lidar and Geiger-mode lidar. The performance of these systems is explained in detail with examples of applications and processing lidar data in real-time for on-site decision-making. The contributing authors are leading experts who are sharing the results of many years of work pioneering lidar technology and taking it to the forefront of geospatial data and analysis. Their experiences and solutions will be of great benefit to professionals, researchers, technologists, and students.

Working with Lidar Using ArcGIS Desktop John McGee, James Campbell, Tammy Parece, 2017-09-26 Lidar imagery provides valuable information in the field of remote sensing, allowing users to determine elevation, vegetation structure, and terrain with remarkable levels of detail. This manual will lead ArcGIS Desktop users through the tools and methods needed to access, process, and analyze lidar data. Foreword by Dr. Valarie Thomas

Elastic Lidar Vladimir A. Kovalev, William E. Eichinger, 2004-04-27 Lidar ist das Akronym für Light Detection and Ranging. Lidar-Systeme arbeiten nach demselben Prinzip wie Radar (Radio Detection and Ranging), tasten die Umgebung in verschiedenen Richtungen und Neigungen jedoch mit einem Impulslaser ab. Beim elastischen Lidar wird Licht, das an den Molekülen und Teilchen in der Atmosphäre gestreut wurde, von einem Teleskop gesammelt und mit einem Photodetektor vermessen. Das Signal wird digitalisiert; man erhält ein detailreiches Echtzeit-Profil der Konzentration von Aerosolen in der Atmosphäre. Dieses Handbuch für Anwender des elastischen Lidars enthält eine tiefgehende Diskussion der praktischen Herangehensweise sowie Informationen zu Inversionstechniken, zur Datenanalyse, zum Aufbau eines elastischen Lidars und zu verschiedenen Testmethoden.

Semi-automated DIRSIG Scene Modeling from 3D Lidar and Passive Imagery Stephen R. Lach, 2008 The Digital Imaging and Remote Sensing Image Generation (DIRSIG) model is an established, first-principles based scene simulation tool that produces synthetic multispectral and hyperspectral images from the visible to long wave infrared (0.4 to 20 microns). Over the last few years, significant enhancements such as spectral polarimetric and active Light Detection and Ranging (lidar) models have also been incorporated into the software, providing an extremely powerful tool for multi-sensor algorithm testing and sensor evaluation. However, the extensive time required to create large-scale scenes has limited DIRSIG's ability to generate scenes 'on demand.' To date, scene generation has been a laborious, time-intensive process, as the terrain model, CAD objects and background maps have to be created and attributed manually. To shorten the time required for this process, this research developed an approach to reduce the man-in-the-loop requirements for several aspects of synthetic scene construction. Through a fusion of 3D lidar data with passive imagery, we were able to semi-automate several of the required tasks in the DIRSIG scene creation process. Additionally, many of the remaining tasks realized a shortened implementation time through this application of multi-modal imagery. Lidar data is exploited to identify ground and object features as well as to define initial tree location and building parameter estimates. These estimates are then refined by analyzing high-resolution

frame array imagery using the concepts of projective geometry in lieu of the more common Euclidean approach found in most traditional photogrammetric references. Spectral imagery is also used to assign material characteristics to the modeled geometric objects. This is achieved through a modified atmospheric compensation applied to raw hyperspectral imagery. These techniques have been successfully applied to imagery collected over the RIT campus and the greater Rochester area. The data used include multiple-return point information provided by an Optech lidar linescanning sensor, multispectral frame array imagery from the Wildfire Airborne Sensor Program (WASP) and WASP-lite sensors, and hyperspectral data from the Modular Imaging Spectrometer Instrument (MISI) and the COMPact Airborne Spectral Sensor (COMPASS). Information from these image sources was fused and processed using the semi-automated approach to provide the DIRSIG input files used to define a synthetic scene. When compared to the standard manual process for creating these files, we achieved approximately a tenfold increase in speed, as well as a significant increase in geometric accuracy.--Abstract.
