Using National Weather Service (NWS) Forecasts and Model Output Statistics (MOS) to Forecast Evapotranspiration Sumana Kandula,2007

Design Study for the Development and Use of Model Output Statistics in Automated Aviation Weather Forecasting Harry R. Glahn,Karl F. Hebenstreit,AIR FORCE GEOPHYSICS LAB HANSCOM AFB MA.,1978 The Air Weather Service is preparing for the WWMCCS era by developing a support concept whereby weather information inputs will be in terms of Weather Impact Indicators (WIIs) which specify the probability that all stages of a mission will have 'favorable' weather. This report presents the design of a system based on the proven Model Output Statistics (MOS) approach to provide, in real-time, acceptably skillful objective estimates of WII probabilities. The system is mission oriented allowing the user to specify the limiting values for the weather elements which impact his mission. If forecast equations for such a mission profile are not already available in the system, forecast equations will be developed, applied, and archived for future use. Acceptable accuracy of these forecasts is essential. A user will not be satisfied with probabilities which, through poor reliability, lead to unexpected losses or which, through poor resolution, furnish little discrimination over and above a simple application of climatology. The design analysis for a real-time MOS system for global application shows such a system to be feasible within the resources of a large-scale computing center such as that operated by the National Oceanic and Atmospheric Administration or the Air Force Global Weather Central.

Air Weather Service Model Output Statistics Systems D. L. Best,S. P. Pryor,AIR FORCE GLOBAL WEATHER CENTRAL OFFUTT AFB NE.,1983 The development and operation of the Air Weather Service Model Output Statistics (MOS) System is described. A short history of the migration of MOS technology and software from the National Weather Service Technique Development Laboratory (TDL) to the Air Force Global Weather Central is provided. Emphasis is placed on the AWS MOS system's integration into the AFGWC production scheme, its capabilities, limitations, and the options available.

The National Weather Service Modernization and Associated Restructuring National Research Council,Division on Earth and Life Studies,Board on Atmospheric Sciences and Climate,Committee on the Assessment of the National Weather Service's Modernization Program,2012-02-25 The Modernization and Associated Restructuring (MAR) of the National Weather Service (NWS) was a large and complex re-engineering of a federal agency. The process lasted a decade and cost an

estimated \$4.5 billion. The result was greater integration of science into weather service activities and improved outreach and coordination with users of weather information. The MAR created a new, modernized NWS, and, significantly, it created a framework that will allow the NWS to keep up with technological changes in a more evolutionary manner. The MAR was both necessary and generally well executed. However, it required revolutionary, often difficult, changes. The procurement of large, complex technical systems presented challenges in and of itself. The MAR also affected the career paths and personal lives of a large portion of the field office workforce. The MAR created a new, modernized NWS, and, significantly, it created a framework that will allow the NWS to keep up with technological changes in a more evolutionary manner. The National Weather Service Modernization and Associated Restructuring presents the first comprehensive assessment of the execution of the MAR and its impact on the provision of weather services in the United States. This report provides an assessment that addresses the past modernization as well as lessons learned to support future improvements to NWS capabilities.

Climate Extremes and Their Implications for Impact and Risk Assessment Jana Sillmann, Sebastian Sippel, Simone Russo, 2019-11-20 Climate extremes often imply significant impacts on human and natural systems, and these extreme events are anticipated to be among the potentially most harmful consequences of a changing climate. However, while extreme event impacts are increasingly recognized, methodologies to address such impacts and the degree of our understanding and prediction capabilities vary widely among different sectors and disciplines. Moreover, traditional climate extreme indices and large-scale multi-model intercomparisons that are used for future projections of extreme events and associated impacts often fall short in capturing the full complexity of impact systems. Climate Extremes and Their Implications for Impact and Risk Assessment describes challenges, opportunities and methodologies for the analysis of the impacts of climate extremes across various sectors to support their impact and risk assessment. It thereby also facilitates cross-sectoral and cross-disciplinary discussions and exchange among climate and impact scientists. The sectors covered include agriculture, terrestrial ecosystems, human health, transport, conflict, and more broadly covering the human-environment nexus. The book concludes with an outlook on the need for more transdisciplinary work and international collaboration between scientists and practitioners to address emergent risks and extreme events towards risk reduction and strengthened societal resilience.

Statistical Downscaling and Bias Correction for Climate Research Douglas Maraun, Martin Widmann, 2018-01-18 Statistical downscaling and bias correction are becoming standard tools in climate impact studies. This book provides a

comprehensive reference to widely-used approaches, and additionally covers the relevant user context and technical background, as well as a synthesis and guidelines for practitioners. It presents the main approaches including statistical downscaling, bias correction and weather generators, along with their underlying assumptions, skill and limitations. Relevant background information on user needs and observational and climate model uncertainties is complemented by concise introductions to the most important concepts in statistical and dynamical modelling. A substantial part is dedicated to the evaluation of regional climate projections and their value in different user contexts. Detailed guidelines for the application of downscaling and the use of downscaled information in practice complete the volume. Its modular approach makes the book accessible for developers and practitioners, graduate students and experienced researchers, as well as impact modellers and decision makers.

Sensitivity of Model Output Statistics on the Lorenz System Joshua S. Coblenz,Massachusetts Institute of Technology.

Department of Earth, Atmospheric, and Planetary Sciences,2009 This project studies the sensitivity of model output statistics (or MOS) in numerical weather prediction to lead times and parameters. In order to study MOS in an idealized setting, I use the simplified Lorenz system of differential equations as the physical model to explore the sensitivity of linear MOS in this non-linear system. MOS finds a statistical relationship between imperfect model variables and true variables using linear regression. The effect on the forecast error of lead time and parameter perturbation are investigated.
