Postural Assessment Scale for Stroke David Gogo, 2020 Introduction: The PASS for Postural Assessment Scale for stroke patient is an instrument evaluating posture and balance after stroke published in Stroke in 1999. We propose 20 years after its creation the first systematic review concerning the use of the PASS throughout the world and summarize its psychometric properties. Material and Methods: Results were extracted from two strategies in order to be exhaustive. First all articles from Web Of Science and citing the seminal article of the PASS was analyzed since 1999 to December 2019. A complementary researches was performed in EMBASE, PUBMED with the key words 'postural, balance', 'stroke' following the COSMIN guideline for conducting systematic reviews. Study selection and quality assessment were performed by two reviewers. Results: We analyzed 105 articles and classified them into categories of use of PASS. Among them, 36 studies analyzed psychometric properties of the PASS and enhanced scale like the SwePASS. All psychometric properties were analyzed and level of evidence of that instrument is high for the main psychometrics according to COSMIN guideline. Conclusion: The PASS had become a gold standard throughout years because of good clinometric properties. However, enhanced versions like the SwePASS suggest some improvements that can be done especially to avoid ceiling effect.

Improving Functional Outcomes in Physical Rehabilitation Susan B O'Sullivan, Thomas J Schmitz, 2016-02-17 Here is a practical, step-by-step guide to understanding the treatment process and selecting the most appropriate intervention for your patient. Superbly illustrated, in-depth coverage shows you how to identify functional deficits, determine what treatments are appropriate, and then to implement them to achieve the best functional outcome for your patients.

Physical Management for Neurological Conditions E-Book Sheila Lennon, Gita Ramdharry, Geert Verheyden, 2023-10-04 Physical Management for Neurological Conditions comprehensively covers the essentials of neurorehabilitation starting with thirteen guiding principles, and a new chapter on clinical reasoning and assessment. It discusses the physical management of common neurological conditions such as stroke, traumatic brain injury, spinal cord injury, multiple sclerosis and Parkinson's followed by less common conditions such as inherited neurological conditions,

motor neuron disease, polyneuropathies and muscle disorders. Produced by a team of international editors and experts, this fifth edition is the most up-to-date evidence-based textbook available for undergraduate students and qualified health professionals alike, focusing on selecting appropriate evidence-based tools rather than subscribing to any specific treatment approaches. It is a core physiotherapy textbook designed to provide students with everything they need to pass the neurological component of their degree. - Fully updated to provide comprehensive information on optimal physical management within movement limitations suitable for any health care context or environment - Using international case studies to apply theory to clinical practice - Easy to navigate and understand - for students, new graduates and therapists returning to practice or changing scope of practice - New content on assessment, clinical reasoning, technology-based rehabilitation, and complex case management including disorders of consciousness and adults with cerebral palsy - Full update of the evidence-base within each chapter, including reference to the increased use of remote delivery of services and challenges accelerated by the Covid-19 pandemic - New international authors

Studies on Spasticity from an Interventional Perspective Per Ertzgaard, 2018-11-22 This thesis focuses on interventional aspects of spasticity, but has a very holistic approach, grounded in the specialty of Rehabilitation medicine. This means capturing the effects of spasticity, on such a complex biological system as the human being, living in a psychosocial context affecting the situation. When evaluating spasticity there are a number of levels of evidence. The first of course, understanding what we mean with spasticity, where there unfortunately is no consensus. The second level is to study if our treatments affect spasticity in a positive direction. The third is to grasp if a decrease in spasticity improve or normalize patient's movement patterns. The fourth level investigates if improvement in movement patterns improve patient's ability to perform activities; and the fifth level, comprising whether this intervention improves life satisfaction. Finally, on a societal level, we wish to investigate whether the improvement in life satisfaction or health related quality of life would motivate society to fund the intervention. Paper I on Goal Attainment Scaling pointed out necessary aspects to consider when using this instrument. This relates, among other things, to the need of learning ("the art of") goal setting and deciding the purpose of the measurements. Research and clinical use puts different demands on the instrument, for the latter time-efficiency and simplicity to use being most important. For research, it is important to be able to register deterioration, and this can be achieved using the 6-step version. In paper II, concerning validation of the portable motion system, we showed this system to be valid for short-term measurements and that the use of Exposure Variation Analysis (EVA) seems to be a valuable tool for graphically elucidating different movements. The equipment needs further development in handling long-term measurements (which is effectuated), and norms for normal movements in different activities has to be produced. The discriminative value of EVA needs confirmation in coming studies. For the future, there is the intriguing possibility of long-term measurements in patients' every-day life, thereby getting objective measures on how our patients use their abilities, thus capturing the

difference between what you can do and what you actually do. The results from paper III demonstrated a large inequality in Sweden regarding the accessibility of BoNT-A treatment for spasticity. We could also show that treatment with BoNT-A is sound from a health-economic perspective, accounting for the uncertainty of data via the sensitivity analysis. For the future, we need to explore if this inequality also exists for other modes of spasticity treatments, e.g. multidisciplinary spasticity treatment and ITB pumps, and in other countries. In paper IV evaluating multifocal TES, the results could not confirm efficacy with the treatment according to the protocol of the manufacturer. The results have to be interpreted with care, as low compliance and frequent adverse events made deduction not captured in the RCT study. Further studies are needed in a number of areas, e.g. what is the optimal stimulation frequency, what patients can gain from the treatment and how should adjunct treatment be organized. In this thesis, I have had the privilege to explore different methods of evaluating spasticity interventions from a multimodal perspective as a starting point in an effort to understand more of this intriguing phenomenon. Some of the research questions above are already in the “pipeline” for coming studies; others are to be planned by our research group and others.

Stroke Rehabilitation Glen Gillen, Ann Burkhardt, 2004 This 2nd edition remains the only comprehensive evidence-based text on the Occupational Therapy management of the stroke patient. The book is based on the most up-to-date research on stroke rehabilitation and presents its content in a holistic fashion, combining aspects of background medical information, samples of functionally based evaluations, and treatment techniques and interventions.
