COPD - Pathology, Diagnosis, Treatment, and Future Directions Steven Jones, 2024-06-05 Chronic obstructive pulmonary disease is a (currently) incurable and irreversible lung condition with worldwide mortality rates similar to stroke, diabetes, and Alzheimer's disease. Treatments are limited to the removal of the underlying causes (e.g., exposure to smoke), easing some of the symptoms, and slowing the rate at which the disease worsens. As a consequence of smoking, it is less well known than lung cancer even though it has an equal or higher mortality rate. It is a combination of diseases that affects bronchioles and alveoli to different extents from patient to patient. An accurate diagnosis of each patient's physiology is potentially useful in tailoring treatment to the underlying physiology. This book provides an overview of the underlying pathology of the disease. It then discusses some of the clinical tools available to obtain pathology-specific diagnosis for a given patient. A section then discusses the consequences of the disease. While some of these consequences are readily expected from a cursory understanding of the disease (anemia and shortness of breath), others are less obvious (muscle atrophy, impaired balance, and cardiac problems). In the final sections, disease treatment is addressed. The book is intended to convey two important points. The first is that hope exists for more effective treatments in the future, while the second is that these treatments will require strong collaborations among researchers in a variety of disciplines.

Chronic Obstructive Pulmonary Disease (COPD) Diagnosis using Electromyography (EMG) Archana Bajirao Kanwade, Vinayak Bairagi, 2022-01-16 Chronic Obstructive Pulmonary Disease (COPD) Diagnosis using Electromyography (EMG) presents a new and innovative method of COPD diagnosis using EMG to analyze sternomastoid muscle activity using features extraction and classification. The book describes the methodology of EMG analysis, the slope-based onset detection algorithm and SEMG analysis in time, frequency and time frequency domain analyses. It also explores the identification of frequencies for single frequency Continuous Wavelet Transform (CWT) analysis and feature extraction and selection for successful classification COPD into its severity grades. The book provides a compilation of all techniques used in the literatures and emphasizes newly proposed techniques for the early detection of COPD. Fully comprehensive, the book includes discussion of limitations of existing methods for COPD diagnosis and introduces new efficient methods for COPD identification, classification and early diagnosis. - Provides an easy, simple and comprehensive guide to using EMG analysis for COPD diagnosis - Presents detailed explanations of the recently developed slope-based onset detection algorithm for

muscle activity detection, along with numerous original figures, tables and graphs to aid interpretation - Includes a complete review of various features, such as extraction using single frequency CWT analysis and the feature selection algorithm for COPD diagnosis

COPD Sang-Do Lee,2017-10-10 This book explains how analysis of the heterogeneity of chronic obstructive pulmonary disease (COPD) enhances understanding of the condition and leads to improved, personalized treatment. State of the art knowledge is presented on a range of issues related to the heterogeneity of COPD, such as phenotypes (clinical, physiologic, radiologic, etc.), genotypes, and the tools to be used for dissecting heterogeneity (CT, MRI, biomarkers, etc.). Especially modern radiologic imaging holds promise in this context, and its role is described in detail with the aid of numerous illustrations. The implications of the heterogeneity for personalized treatment are clearly identified, with description of an appropriate tailored treatment strategy for each subgroup of patients. Information is provided on both current and emerging strategies, including bronchoscopic lung volume reduction and approaches to the management of pulmonary hypertension and comorbidities. This book will be a great asset in clinical practice and research for all who have an interest in COPD, a leading cause of morbidity and mortality worldwide.

Chronic Obstructive Pulmonary Disease Hiroyuki Nakamura,Kazutetsu Aoshiba,2016-10-31 This book considers chronic obstructive pulmonary disease (COPD) not as a simple inflammation of the lung but as a systemic inflammatory disease. Beginning with epidemiological studies, etiology, diagnosis and treatment, it elaborates further, illustrating some comorbidities and associations with other respiratory diseases. As such it provides numerous improved and more comprehensive treatment methods, including drug therapies as well as some non-drug therapies. There are also chapters describing the pathogenesis, genetic abnormalities and newly discovered pathogenetic mechanisms that are expected to be studied further in the future. Edited and written by pioneering researchers, each chapter summarizes the latest trends, describes future prospects and explores the unresolved and critical questions. Chronic Obstructive Pulmonary Disease - A Systemic Inflammatory Disease is a valuable resource to beginning researchers, physicians engaged in clinical practice, supervisors, and basic researchers whose work includes COPD.

Influence of Dietary Factors, Nutrients, and the Gut-Lung Axis on Respiratory Health Tomoko Suzuki,Naser Alsharairi,Inês Brandão,2025-02-21 Dietary habits and nutrients are gaining increasing recognition as modifiable factors influencing respiratory health. Food components including vitamins, minerals, fatty acids and bioactive compounds like flavonoids, through their antioxidant and anti-inflammatory properties, have been associated with ameliorated lung function and attenuated viral infections. To illustrate this, multiple studies show that the Mediterranean diet, known for its emphasis on fruits, vegetables, whole grains, and olive oil, has a beneficial effect on respiratory health. Furthermore, the dynamic

interplay between diet and lungs appears to revolve around the immune system, making immune interactions a central topic of discussion. The substantial influence of the gut microbiota becomes evident when considering that approximately 70-80% of immune cells reside in the gut. Hence, the gut microbiota emerges as a crucial mediator of the impact of food on health, including respiratory health. Gut dysbiosis is believed to be associated with the etiology of respiratory/lung diseases, such as asthma, COPD, chronic bronchitis, emphysema, and lung cancer. Microbiota-derived metabolites such as short-chain fatty acids (SCFAs) produced from the fermentation of non-digestible carbohydrates have been reported to regulate gut inflammation. Probiotics, SCFAs, bioactive compounds and dietary fiber, as well as restricted dietary patterns, have been shown to reduce gut inflammation and play a protective role in respiratory diseases. However, the exact mechanisms underlying these processes are still to be unravelled.

Theory and Practice of Risk Assessment Christos P. Kitsos, Teresa A. Oliveira, Alexandros Rigas, Sneha Gulati, 2015-05-18 This book covers the latest results in the field of risk analysis. Presented topics include probabilistic models in cancer research, models and methods in longevity, epidemiology of cancer risk, engineering reliability and economical risk problems. The contributions of this volume originate from the 5th International Conference on Risk Analysis (ICRA 5). The conference brought together researchers and practitioners working in the field of risk analysis in order to present new theoretical and computational methods with applications in biology, environmental sciences, public health, economics and finance.

Cross-sectional and Longitudinal Analysis of the COPD Assessment Test in a Canadian Population of Men and Women with Early and Moderate-severe COPD Nisha Gupta, 2015 Background and objectives: The recently updated Global Initiative for Chronic Obstructive Lung Disease (GOLD) strategy recommends a new multidimensional approach for chronic obstructive pulmonary disease (COPD) assessment and management that now includes patient perceived disease impact. It proposes using the COPD Assessment Test (CAT) to measure the impact of COPD on wellbeing. This self-administered questionnaire provides a simple quantified measure of health-related quality of life (HRQoL). Summarising the current knowledge on the performance of this tool as a HRQoL measurement instrument is warranted, especially as the test could have important roles in COPD clinical practise and research. We aimed to systematically search the literature to evaluate the psychometric properties of the CAT (reliability, validity, responsiveness and minimum clinically important difference (MCID)) as a HRQoL instrument used in patients with COPD, and evaluate the validity of the CAT in specific patient population characteristics and measure the annual change in CAT score over 3 years. Methods: A systematic review was performed to assess the psychometric properties of the CAT in adults with COPD and to identify gaps within the literature concerning the questionnaire. The CAT was administered at baseline, 1.5 and 3 years to subjects with COPD in a population-based, prospective multicentre cohort study conducted throughout Canada. The CAT total score was determined for different levels of COPD disease stage, sex, age and smoking status. Mixed-effects linear models were used to estimate the relationship between the change in CAT score over the range of observed study years. Results: The systematic review identified 36 studies that evaluated CAT psychometric properties. Internal consistency (reliability) was 0.85-0.98 and test-retest reliability was 0.80-0.96. CAT total scores differed with GOLD stages and exacerbation. Mean scores decreased with pulmonary rehabilitation (2.2-3 units) and increased at exacerbation onset (4.7 units). Only one study with adequate methodology reported an MCID of 2 units and 3.3-3.8 units using the anchor-based approach and distribution-based approach, respectively. None of the studies conducted a longitudinal evaluation past 6 months. For the study in Canada, 643 subjects with COPD were included in the analysis. The mean CAT total score was 7.8 ± 6.6 , 5.7 ± 5.0 , 9.6 ± 6.7 and 14.9 ± 9.3 for all subjects, GOLD I, II and III+, respectively. Females scored higher than males in all GOLD grades, though it was only statistically significant in GOLD I and II. The interaction effect between year and GOLD stage demonstrated that the annual change in CAT score over 3 years differed among the three GOLD groups, particularly in GOLD III+ compared with GOLD I ($\beta = -1.08$, 95% CI (-2.02, -0.16)). The CAT score did not show any significant change over the study period of 3 years in each GOLD grade. Conclusions: Studies support the CAT's reliability, validity and responsiveness, however the MCID remains debatable. The characterisation of CAT scores in particular patient populations established that females scored higher than

males in all GOLD grades. Three-year longitudinal follow-up could not show any significant change in CAT score among GOLD grades. --
