Physical Models Bill Addis, Karl-Eugen Kurrer, Werner Lorenz, 2020-09-25 Physical models have been, and continue to be used by engineers when faced with unprecedented challenges, when engineering science has been inadequate or even non-existent, and in any other situation when engineers have needed to raise their confidence in a design proposal to a sufficient level in order to begin construction. For this reason, models have mostly been used by designers and constructors of highly innovative projects, when previous experience has not been available. The book covers the history of using physical models in the design and development of civil and building engineering projects including Robert Stephenson's Britannia Bridge in the 1840s, the masonry Aswan Dam in the 1890s and the Boulder Dam in the 1930s; tidal flow in estuaries and wind and seismic loads on structures from the 1890s, the acoustics of concert halls and the design of thin concrete shell roofs from the 1920s, and the dynamic behaviour of tall buildings from the 1930s, as well as cable-net and membrane structures in the 1960s. Individual designers featured include Eduardo Torroja, Pier Luigi Nervi, Heinz Hossdorf, Heinz Isler, Frei Otto, Sergio Musmeci and Mamoru Kawaguchi. The book concludes with overviews of the current use of physical models alongside computer models, for example in boundary layer wind tunnels, seismic engineering, hydrology, soil mechanics, and air flow in buildings. Traditionally, progress in engineering has been attributed to the creation and use of engineering science, the understanding of materials properties and the development of new construction methods. The book argues that the use of reduced-scale models has played an equally important part in the development of civil and building engineering. However, like the history of engineering design itself, this crucial contribution has not been widely reported or celebrated. The book includes 39 chapters written by 29 authors from ten different countries.

Monografía del género Carex en la Península Ibérica e Islas Baleares Modesto Luceño, 1994 Se presenta una revisión actualizada de los 99 táxones (89 especies y 10 subespecies) que integran el género Carex en la Península Ibérica e Islas Baleares. En la primera parte (Introducción) se comenta el origen del nombre, se describen las principales características del género (morfológicas y citogenéticas) y se expone la clasificación en subgéneros más admitida en la actualidad. En el segundo capítulo se presenta una clave de todas las especies, a la que sigue la descripción de las mismas siguiendo el modelo al uso en la obra Flora ibérica. Estas descripciones contienen, además de los datos morfológicos, todos los números de cromosomas conocidos hasta la fecha para los táxones ibéricos, así como datos ecológicos, la distribución general de cada taxon y las provincias ibéricas en las que habita. Las descripciones van acompañadas de numerosas observaciones en las que se exponen diferentes problemas taxonómicos o nomenclaturales. Se ha hecho un esfuerzo de revisión nomenclatural y se presentan todos los nombres que han sido usados en el territorio objeto de estudio. Igualmente se recoge la indicación locotípica de cada taxon. Han sido dibujados 24 táxones, entre los cuales están todos los endemismos, y se presentan siete figuras que ayudan a comprender determinados caracteres.
