Trends in Inflammation Research James A. Pitzer, 2006 The process of inflammation, which causes the swelling and redness around a wound, is a vital part of the body's system for fighting off infections. When the body is hurt, the immune system produces chemical signals telling cells to multiply without dying, allowing skin to close over a gash, for example. Other chemicals spur the growth of new blood vessels to feed the recovering tissue. Scientists have linked inflammation to cancer and recently to heart disease in several ways. Doctors suspect that long-term inflammation or infection is involved in up to 20 per cent of cancers, including those of the oesophagus, colon, skin, stomach, liver, bladder, breast and some kinds of lymphoma. C-reactive protein (CRP) is one of the acute phase proteins that increase during systemic inflammation. It's been suggested that testing CRP levels in the blood may be a new way to assess cardiovascular disease risk. A high sensitivity assay for CRP test (hs-CRP) is now widely available. This book presents recent leading-edge research from around the world.

New Developments in Cancer Research Lee P. Jeffries, 2006 Cancer is a group of different diseases (over 100) characterised by uncontrolled growth and spread of abnormal cells. Cancer can arise in many sites and behave differently depending on its organ of origin. If a cancer spreads (metastasizes), the new tumour bears the same name as the original (primary) tumour. Significant progress has been made in recent years in the battle against cancer and in understanding its underlying biological mechanisms. This research progress has resulted in many experimental treatments and cures which establish hope for wide-spread cures. The book brings together important research from around the world in this frontal field.
