**James Temple Robinson**

Hemoglobin and Red Cell Structure and Function George Brewer, 1972-10 A number of fascinating papers were presented on various aspects of hemoglobin, its structure, its interaction with ligands such as oxygen, and its properties under varying conditions. Red cell metabolism was considered, in depth, from many viewpoints, including defects in uremia, interactions with serum phosphorous, male-female differences, the role of catalase, genetic selection for quantitative variation, and mechanisms of glycolytic response to altitude stress and to anemia. As with the first conference, a session was devoted to the continuing assessment of the importance of decline in red cell oxygen transport functional capacity during blood bank storage. A session was also devoted to consideration of carbonic anhydrase and carbon dioxide transport, and the interaction of this area with oxygen transport. A high point of the conference was the session on sickle cell structure and function.

*Biology for the IB Diploma Coursebook with Free Online Material* Brenda Walpole, Ashby Merson-Davies, Leighton Dann, Peter Hoeben, Mark Headlee, 2014-03-13 Biology for the IB Diploma, Second edition covers in full the requirements of the IB syllabus for Biology for first examination in 2016. The History of Alternative Test Methods in Toxicology, 2018-10-20 The History of Alternative Test Methods in Toxicology uses a chronological approach to demonstrate how the use of alternative methods has evolved from their conception as adjuncts to traditional animal toxicity tests to replacements for them. This volume in the History of Toxicology and Environmental Health series explores the history of alternative test development, validation, and use, with an emphasis on humanity and good science, in line with the Three Rs (Replacement, Reduction, Refinement) concept expounded by William Russell and Rex Burch in 1959 in their now classic volume, *The Principles of Humane Experimental Technique*. The book describes the historical development of technologies that have influenced the application of alternatives in toxicology and

safety testing. These range from single cell monocultures to sophisticated, miniaturised and microfluidic organism-on-a-chip devices, and also include molecular modelling, chemoinformatics and QSAR analysis, and the use of stem cells, tissue engineering and hollow fibre bioreactors. This has been facilitated by the wider availability of human tissues, advances in tissue culture, analytical and diagnostic methods, increases in computational processing, capabilities, and a greater understanding of cell biology and molecular mechanisms of toxicity. These technological developments have enhanced the range and information content of the toxicity endpoints detected, and therefore the relevance of test systems and data interpretation, while new techniques for non-invasive diagnostic imaging and high resolution detection methods have permitted an increased role for human studies. Several key examples of how these technologies are being harnessed to meet 21st century safety assessment challenges are provided, including their deployment in integrated testing schemes in conjunction with kinetic modelling, and in specialized areas, such as inhalation toxicity studies.
