Handbook of Neurologic Rating Scales, 2nd Edition, Rating scales are used daily by everyone involved in the management of patients with neurologic disease and in the design and management of neurologic clinical trials. Now there is a single source for the wide range of scales used in specific neurologic diseases and neurorehabilitation. You will refer to this volume constantly! The first edition of the Handbook of Neurologic Rating Scales quickly became an invaluable reference work on the increasing array of scales for measuring neurologic disease. In the brief few years since the first edition the importance of this book has only increased. New Chapters Include Scales On: Generic and general use Pediatric neurology and rehabilitation Peripheral neuropathy and pain Ataxia HIV/AIDS And instruments for diagnosing headaches. Formal measurement of the effects of neurologic disease and of treatment effects, beyond the description of changes on the standard neurologic examination, is a relatively recent development. Controlled clinical trials and outcomes research are at the heart of modern information-based medicine, and neurologic scales are essential tools in clinical trials designed to provide this information. A Resource for Clinical Trials The Handbook of Neurologic Rating Scales provides a resource for clinicians and clinical investigators in the broad field of neurology and neurologic rehabilitation to help them: evaluate the clinical trials literature by providing information on the scales being used evaluate and select appropriate and efficient scales for clinical trials and outcomes research, and provide information that will help them to develop new scales or measures or to improve existing ones. A Resource for Evaluating Disease Status Outcomes research is playing an increasingly important role in clinical management and neurorehabilitation, and these also depend largely on measurement of disease status and change. In this era of managed care, neurologists must produce outcomes data demonstrating the effectiveness of neurologic care if the specialty is to survive, and certainly if it is to thrive. Even effective therapies are likely to fall by the wayside if studies to prove their effectiveness are not done. Comprehensive and Standardized Information on All Scales Each chapter in this volume contains the scales of importance and in current use, including a sequence of scale descriptions and specific scales in

a standard format, as well as a summary and recommendations indicating which scales are most useful for specific purposes and whether a combination of scales is particularly useful or if better scales are needed. Each entry notes: the purpose for which the scale was developed and its current uses if they differ from those for which it was developed a detailed description of the scale information about validation, such as: Does the scale have face validity? i.e., does it appear to measure what it purports to measure? how and by whom the scale is administered the time needed to administer and score the scale the scale itself or, when the scale is proprietary or too long for inclusion, a description and key references special considerations, including unusual measures needed to obtain a valid score or problems in administering the test in specific patients advantages, or what makes the scale good or useful. Disadvantages, or what makes the scale difficult to use or impairs its reliability key references, including the original publication of the scale and its validation Downloadable PDFs of the scales contained in the Handbook of Neurologic Rating Scales are included with the purchase of this book. The password to download the files can be found in the book itself.

Memory Disorders in Clinical Practice Narinder Kapur, 2017-09-29 This book has been specially designed to give practical help to those who have to deal with diagnosis and subsequent management of patients with memory disturbance resulting from specific types of cerebral pathology. The author achieves this by organising his book on the basis of clinical aetiology. While anatomical and psychological perspectives are introduced, the emphasis is on approaches which will help clinicians in the management of patients with specific neurological diseases. For example, the essential topic of differential diagnosis is given prominence throughout: the principles of diagnostic assessment are discussed in a separate chapter, and specific diagnostic features are outlined in each of the chapters dealing with individual cerebral pathologies. The author draws on his own extensive experience as a practising clinical neuropsychologist to describe and evaluate the range of existing memory test procedures, and suggest additional procedures as appropriate. Full references are also given for those wishing to develop their own assessment of therapeutic procedures. Mainly intended for practising neurologists and clinical neuropsychologists, anyone whose work brings them into contact with patients suffering from memory disturbance will find this book invaluable.

The Assessment, Evaluation and Rehabilitation of Everyday Memory Problems Barbara A. Wilson, 2013-11-07 In the World Library of Psychologists series, international experts present career-long collections of what they judge to be their finest work—extracts from books, key articles, salient research findings and their major theoretical and practical contributions. This volume of self-selected papers recognises Professor Barbara A. Wilson's major contribution to the study of neuropsychology. Published over a 25-year period, the papers included here address the assessment, treatment and evaluation of rehabilitation provided to people who have memory difficulties arising from an injury or illness affecting the brain. This selection of papers includes work on errorless learning, the natural history of the development of compensatory memory systems, paging systems developed to enhance independent daily living for memory impaired people and single-case experimental designs to appraise the response of individual patients. The final section includes a practical framework for understanding compensatory behaviour, a model of cognitive rehabilitation and a discussion of the dilemmas created by the different aims of neuroscience as opposed to those of clinicians. This book will be of great interest to clinical psychologists, neuropsychologists, occupational therapists and speech and language therapists, along with anyone who is interested in reducing the impact of memory problems on people who have suffered brain injury.

Nursing Considerations for Post-traumatic Amnesia After a Traumatic Brain Injury Hannah Grant, 2022 A period known as post-traumatic amnesia (PTA) often follows a traumatic brain injury (TBI). PTA is characterized by anterograde and retrograde amnesia, confusion, disorientation, and agitation. The duration and severity of PTA is a key indicator of the long-term prognosis after a TBI, so proper assessment and nursing care of a PTA patient is crucial. TBIs range from mild to severe, but primarily affect the fronto-temporal lobes. In PTA, both neural lesions and white matter damage within the parahippocampal region can cause PTA. A nurse must perform a thorough assessment of a TBI patient, but, since PTA is a key indicator of a TBI, a nurse must be familiar with the PTA assessment scales, particularly when comparing the Westmead Post-Traumatic Amnesia Scale (WPTAS) and the Galveston Orientation and Amnesia Test (GOAT). Finally, multi-disciplinary care of a TBI patient within PTA patient must include evidence-based pharmacological and nonpharmacological treatments, nursing considerations, nutritional considerations, physical and occupational therapy, and psychosocial implications.

Estimation of Post-traumatic Amnesia in Emergency Department Attendees Presenting with Head Injury Louise Richards, 2011 Objectives: To explore whether a semi-structured post-traumatic amnesia (PTA) assessment interview (PTA-I) provides a practicable but equivalent estimation of PTA in patients attending the Emergency Department (ED) with head injury (HI) compared to the established Westmead PTA Scale Revised (R-WPTAS). Procedure: PTA was assessed using the R-WPTAS (includes a visual memory component) and the PTA-I (includes retrospective and verbal memory components), in

patients attending an ED with (n=30) or without (n= 30) HI. Outcome measures were the Post-concussion Syndrome Checklist (PCSC) and the Glasgow Coma Scale (GCS). McNemar's Tests and Chi-square analyses were used to determine the results. Results: The verbal memory component overestimated PTA in the control group by 24 %. Overall, the PTA-I did not discriminate between HI and control participants. However the retrospective PTA assessment embedded within the PTA-I did, with 100 % accuracy. Conclusions: The use of a verbal memory component to assess PTA in the ED is not supported by the results of this study. A retrospective PTA assessment appears to allow more accurate decision making regarding the admission criteria used in the ED and has advantages over the R-WPTAS: fewer test materials and no repeat assessments required to achieve an estimate of PTA duration.
