Cell Cycle Dereglulation in Cancer Greg H. Enders,2012-05-04 Cancer is fundamentally a disease of abnormal cell proliferation: Cancer cells multiply when and where they should not. This proliferation entails escape from normal bounds imposed by the tissue environment, the internal biology of the cell (DNA damage, chromosomal imbalances, disorganized mitotic spindles), and the proliferative history of the cell (normal generational times). Some of the key oncogenic events in cancer directly perturb proteins that regulate progression through the cell division cycle, others alter cell cycle progression indirectly, through effects on signaling pathway that impinge on the cell cycle. This biology is fundamentally important in cancer therapy. Many of the workhorse treatments for cancer rely on killing proliferating cells. Furthermore, there is growing recognition that stem cell-transit amplifying cell hierarchies may persist or be generated during tumorigenesis, generating important functional heterogeneity in cell cycle control among tumor cells, with far-reaching scientific and clinical implications. This volume outlines major cell cycle perturbations that drive tumorigenesis and considers the prospects for using such knowledge in cancer therapy.

PATH - Proliferation-Accumulation-Tumor-Hypothesis Thomas Wascher,2018-08-15 What is or what does a gene mutation do? A gene mutation, i.e. the damage of a gene, leads to a gene expressing more, less or modified proteins. These altered proteins alter the behaviour of the cell. And this is how cancer is ultimately to develop: Changed proteins due to changes in the genes. But what would happen if these changes in the proteins were not caused by mutations in the genes, but by direct damage to the proteins? Then the result cancer would be the same, but otherwise everything would be different. And cancer could be curable. We cannot reverse a mutation, but we can reverse a mechanical process such as protein accumulation. At least we could considerably influence such a carcinogenesis. The proliferation-accumulation-tumour-hypothesis describes how this might be possible. According to PATH, cancer is not a mutation disease, but a protein accumulation disease. But a protein accumulation (protein oxidation / protein aggregation) in immortal stem cells. And a protein accumulation that affecting 400 protein types (mainly cell cycle proteins) and millions of protein copies simultaneously. A protein accumulation in which autophagocytosis in the G0 phase - as the most important proteolysis factor - is no longer sufficiently effective. PATH is based on the latest findings on the ubiquitin proteasome system, cyclins (in particular Cyclin-D-CDK4,6) and autophagy (according to Ohsumi's findings) and their role in the development of tumours.

And PATH also shows why certain forms of treatment and substances (e.g. acetylsalicylic acid [aspirin], metformin, 2-deoxy-2-glucose, methadone, terfenadine, etc.) have a certain effect in studies. And how cancer could possibly be hindered in its development to such an extent that a lethal effect is omitted. For example, PATH also explains better why a person has a 50% chance of developing cancer or at least a 25% chance of dying from it. The most important basis for the development of PATH was the rigorous detachment from the cancer multimutation principle, which has not been effective to date, and the exclusive reorientation towards the most probable and logical facts and conclusions. And the realization: „What is the cause of death for at least 25% of all people cannot be something that has to be caused by a rare, undirected coincidence (mutation).“

Principles of Cancer Biology Lewis J. Kleinsmith, 2013-10-03 *Principles of Cancer Biology*, is an engaging book focused on providing students with a “big picture” view of cancer. Author Lewis Kleinsmith has written an instructional text focusing on key concepts for both students and a general audience. For those instructors who wish to delve into particular aspects of cancer biology in greater depth, each chapter contains a list of suggested readings that expand the detail as needed. The text also emphasizes the scientific evidence that underlies cancer biology, and teaches students to think critically about this evidence- as there are constantly new “breakthroughs” and reports in this field. For students who need the review, there are brief reviews of several topics related to DNA replication and repair, cell division, cell signaling, and inheritance patterns in chapters where these subjects are relevant. By including these reviews, the text is both accessible and engaging to a broad audience of readers who are studying cancer biology for the first time, as well as an interested general audience.

THE SOCIETY OF CELLS Carlos Sonnenschein, A. SOTO, 1999 Despite decades of work and financial support to explore the somatic mutation theory of carcinogenesis, we appear no nearer to explaining how cancer arises. This requires researchers to take stock and consider new hypotheses and alternative approaches to the study of control of cell proliferation, and cancer in particular. The Society of Cells is intended to encourage such a revaluation and proposes the adoption of new premises to explore these important subjects.
