The Machinery of Life David S. Goodsell, 2013-03-09 All living cells are made up of an extraordinary collection of tiny molecular machines, which orchestrate the millions of tasks needed for life. Cells build these machines for a variety of purposes: to digest food, to propel them to fertile feeding grounds or away from predators, to store the genetic blueprint, and to fight disease-causing invaders. *The Machinery of Life* is a journey into the sub-microscopic world of molecular machines. The reader is first introduced to the types of molecules built by cells: proteins, nucleic acids, lipids, and polysaccharides. In a series of distinctive illustrations, the reader is then guided through the interior world of cells, exploring the ways in which molecules work in concert to perform the processes of living. Finally, the book shows how vitamins, viruses, poisons, and drugs each have their effects on the molecules in our bodies. The author and illustrator, David Goodsell, has prepared a fascinating introduction to biochemistry for the nonspecialist. This book combines a clear text with an abundance of drawings and computer graphics that present the world of cells and their components in a new and unique way.

The Machinery of Life David S. Goodsell, 2009 An introduction to biochemistry for the nonspecialist combines a clear text with an abundance of drawings and computer graphics that present the world of cells and their components.

Our Molecular Nature David S. Goodsell, 2012-12-06 *Molecular Nature* is a richly illustrated guide to the extraordinary diversity of molecules that are responsible for life. David Goodsell, author of the highly-praised book, *The Machinery of Life*, has synthesized a vast amount of data in a manner that is accessible to the general reader. *Molecular Nature* examines topics ranging from the shape of cells to the molecules responsible for digestion, immunity, and thought. The author's unique combination of scientific and artistic talents make this a readable, stimulating and highly evocative book. About the Author:

David Goodsell is in the Department of Molecular Biology at the Research Institute of Scripps Clinic in La Jolla, California. His research involves computer graphics and X-ray crystallography. He is the author of *The Machinery of Life* (Springer-Verlag, 1992), and his artwork has been shown at exhibitions on science and art.

Atomic Evidence David S. Goodsell, 2016-08-04 This book will take an evidence-based approach to current knowledge about biomolecules and their place in our lives, inviting readers to explore how we know what we know, and how current gaps in knowledge may influence the way we approach the information. Biomolecular science is increasingly important in our everyday life, influencing the choices we make about our diet, our health, and our wellness. Often, however, information about biomolecular science is presented as a list of immutable facts, discouraging critical thought. The book will introduce the basic tools of structural biology, supply real-life examples, and encourage critical thought about aspects of biology that are still not fully understood.

Principles of Thermal Ecology: Temperature, Energy and Life Andrew Clarke, 2017-09-08 Temperature affects everything. It influences all aspects of the physical environment and governs any process that involves a flow of energy, setting boundaries on what an organism can or cannot do. This novel textbook reveals the key principles behind the complex relationship between organisms and temperature, namely the science of thermal ecology. It starts by providing a rigorous framework for understanding the flow of energy in and out of the organism, before describing the influence of temperature on what organisms can do and how fast they can do it. With these fundamental principles covered, the bulk of the book explores thermal ecology itself, incorporating the important extra dimension of interactions with other organisms. An entire chapter is devoted to the crucially important subject of how organisms are responding to climate change. Indeed, the threat of rapid climatic change on a global scale is a stark reminder of the challenges that remain for evolutionary thermal biologists, and adds a sense of urgency to this book's mission.

Viral Behaviors Roberta Buiani, 2024-08-22 In a new era of global virology that requires novel methodologies to improve the comprehension of viruses and viral phenomena, *Viral Behaviors* explores the cultural, material, and artistic significance of viral agents. Across a rich variety of case studies stemming from different areas of interest-covering literature, the graphic arts and scientific visualization, as well as performance, installation and bioart-this book asks whether embracing the complexity of viruses, rather than obsessively measuring, dissecting, or precisely mapping their parts and manifestations, may provide new methodological directions in the intersection of scientific thinking and artistic practice. The book examines

the struggles and successes of science and technology to tame the elusive nature and behavior of viruses, and the potential of art-based and cross-disciplinary collaborations to better communicate their complex making and intense entanglement with the world at large. Combining perspectives from art, philosophy, science and technology, it places biological and informational viruses alongside each other, revealing that, while the two types of agents affect the world in very different ways, their histories and manifestations contain surprising similarities that speak to a cultural continuum. *Viral Behaviors* unravels the extraordinary mobility of viruses across disciplines, and their intersection with all aspects of culture, rather than their import within one specific disciplinary realm. It shows how the numerous attempts by artists, scientists and professionals to tackle, represent and appropriate viruses, and their intricate dynamism, can lead to new nuanced and sophisticated understandings of these substances and their related phenomena, and reveals the contribution of non-measurable or non-traditional practices in their construction and dissemination.

Rendering Life Molecular Natasha Myers, 2015-08-27 What are living bodies made of? Protein modelers tell us that our cells are composed of millions of proteins, intricately folded molecular structures on the scale of nanoparticles. Proteins twist and wriggle as they carry out the activities that keep cells alive. Figuring out how to make these unruly substances visible, tangible, and workable is a challenging task, one that is not readily automated, even by the fastest computers. Natasha Myers explores what protein modelers must do to render three-dimensional, atomic-resolution models of these lively materials. *Rendering Life Molecular* shows that protein models are not just informed by scientific data: model building entangles a modeler's entire sensorium, and modelers must learn to feel their way through the data in order to interpret molecular forms. Myers takes us into protein modeling laboratories and classrooms, tracking how gesture, affect, imagination, and intuition shape practices of objectivity. Asking, 'What is life becoming in modelers' hands?' she tunes into the ways they animate molecules through their moving bodies and other media. In the process she amplifies an otherwise muted liveliness inflecting mechanistic accounts of the stuff of life.

Representation in Scientific Practice Revisited Catelijne Coopmans, Janet Vertesi, Michael E. Lynch, Steve Woolgar, 2014-01-03 A fresh approach to visualization practices in the sciences that considers novel forms of imaging technology and draws on recent theoretical perspectives on representation. *Representation in Scientific Practice*, published by the MIT Press in 1990, helped coalesce a long-standing interest in scientific visualization among historians, philosophers, and sociologists of science and remains a touchstone for current investigations in science and technology studies. This volume revisits the topic, taking into account both the changing conceptual landscape of STS and the emergence of new imaging technologies in scientific practice. It offers cutting-edge research on a broad array of fields that study information as well as short reflections on the evolution of the field by leading scholars, including some of the contributors to the 1990

volume. The essays consider the ways in which viewing experiences are crafted in the digital era; the embodied nature of work with digital technologies; the constitutive role of materials and technologies—from chalkboards to brain scans—in the production of new scientific knowledge; the metaphors and images mobilized by communities of practice; and the status and significance of scientific imagery in professional and popular culture. Contributors Morana Alač, Michael Barany, Anne Beaulieu, Annamaria Carusi, Catelijne Coopmans, Lorraine Daston, Sarah de Rijcke, Joseph Dumit, Emma Frow, Yann Giraud, Aud Sissel Hoel, Martin Kemp, Bruno Latour, John Law, Michael Lynch, Donald MacKenzie, Cyrus Mody, Natasha Myers, Rachel Prentice, Arie Rip, Martin Ruivenkamp, Lucy Suchman, Janet Vertesi, Steve Woolgar
