Air Crash Investigations: The End of the Concorde Era, the Crash of Air France Flight 4590 George Cramoisi,2010-12 On Tuesday 25 July 2000 Air France Flight AFR 4590, a Concorde registered F-BTSC, took off from Paris Charles de Gaulle, to undertake a charter flight to New York with nine crew members and one hundred passengers on board. During takeoff from runway 26 right at Roissy Charles de Gaulle Airport, a tyre was damaged. A major fire broke out. The aircraft was unable to gain height or speed and crashed onto a hotel, killing all 109 people on board and 4 on the ground. The crash would become the end of the Concorde era.

Plates and Shells Michel Fortin,1999 This volume features the proceedings from the Summer Seminar of the Canadian Mathematical Society held at Université Laval. The purpose of the seminar was to gather both mathematicians and engineers interested in the theory or application of plates and shells, or more generally, in the modelisation of thin structures. From this, it was hoped that a better understanding of the problem would emerge for both groups of professionals. New aspects from the mathematical point of view and new applications posing new challenges are reported. This volume offers a snapshot of the state of the art of this rapidly evolving topic.

Étude thermomécanique des disques de frein Ali Belhocine,2013-04-18 L’objet de cette thèse est de présenter une étude du comportement thermomécanique des disques de frein automobiles pour la prédiction de leur tenue en fatigue. La stratégie de calcul numérique est repose sur le code de calcul Ansys v.11. Ce dernier qui est basé sur la méthode des éléments finis et qui possède des algorithmes de gestion du contact avec frottement est utilisé pour simuler dans l’application du freinage le comportement du mécanisme malgré son complexité. Dans un premier temps, est présentée une analyse des phénomènes thermiques opérant dans un disque de frein en service (flux de chaleur généré par frottement, gradients thermiques élevés, élévation de température). Cette modélisation est effectuée en tenant compte l’influence d’un certains nombre de paramètre tel que le type de freinage, le mode de refroidissement, les matériaux de conceptions. Ensuite, une étude purement mécanique du contact sec entre le disque et plaquettes est développée avec une bonne prédiction devient un enjeu majeur pour les industriels tout en modélisant le chargement et les conditions aux limites autours du disque. Nous avons utilisé le même code de calcul pour visualiser les déplacements, les déformations globales dans le disque, les contraintes de cisaillement, les contraintes de Von Mises et les outils de contact des plaquettes tout en effectuant une

étude paramétrique telle que (le module de Young des plaquettes, le coefficient de frottement , le type de chargement , la vitesse de rotation du disque ,..) pour voir sa sensibilité sur les résultats de calcul. Ainsi, les analyses faites sur le comportement thermique et mécanique que de ces prototypes montrent que ces types de solutions technologiques représentent de réelles pistes d'amélioration qui répond au besoin de l'ingénieur en charge de la conception des disques de frein.
