**Production and Operations Analytics** Steven Nahmias, Tava Lennon Olsen, 2020-10-01 Nahmias and Olsen skillfully blend comprehensive coverage of topics with careful integration of mathematics. The authors' decades of experience in the field contributed to the success of previous editions; the eighth edition continues the long tradition of excellence. Clearly written, reasonably priced, with an abundance of expertly formulated practice problems and updated examples, this textbook is essential reading for analyzing and improving all facets of operations. Some of the material in the newest edition has been reorganized. For example, the first chapter introduces service strategy, the product/process matrix and flexible manufacturing systems, benchmarking, the productivity frontier, the innovation curve, and lean production as a strategy. The focus is slightly more international. The analysis of capacity growth planning now appears in the chapter on supply chain analytics. Aggregate planning details were added to chapter 3, including chase and level strategies in an appendix to the chapter. There is an expanded discussion on risk pooling in the chapter on supply chain strategy. The mechanics behind lean production are included in the chapter on push and pull production systems. The chapter on quality and assurance downplays sampling in favor of discussions of quality management, process capability, and the waste elimination side of lean. The separate chapter on facilities layout and location was eliminated and the information redistributed throughout the text. The authors reinforce the learning process through key points at the beginning of each chapter to guide the reader, snapshots that provide useful examples of applications to businesses, and historical notes that provide a context for the topics discussed. Production and Operations Analytics, 8/e provides the tools for adapting to the dynamic global marketplace.

**Design and Operation of Production Networks for Mass Personalization in the Era of Cloud Technology** Dimitris Mourtzis, 2021-11-10 Design and Operation of Production Networks for Mass Personalization in the Era of Cloud Technology draws on the latest industry advances to provide everything needed for the effective implementation of this powerful tool. Shorter product lifecycles have increased pressure on manufacturers through the increasing variety and complexity of production, challenging their workforce to remain competitive and profitable. This has led to innovation in production network methodologies, which together with opportunities provided by new digital technologies has fed a rapid evolution of production engineering that has opened new solutions to the challenges of mass personalization and market uncertainty. In addition to the latest developments in cloud technology, reference is made to key enabling technologies,

including artificial intelligence, the digital twin, big data analytics, and the internet of things (IoT) to help users integrate the cloud approach with a fully digitalized production system. - Presents diverse cases that show how cloud-based technologies can be used in different ways as part of the standard operation of global production networks - Provides detailed reviews of new technologies like the digital twin, big data analytics, and blockchain to provide context on the role of cloud technologies in a fully digitalized system - Explores future trends for cloud technology and production engineering

Eco-Innovation and Green Productivity for Sustainable Production and Consumption, 2nd edition Munir Ahmad,Cem Işık ,Zeeshan Fareed,2025-09-12 With the graduation of time, the desire for enhanced production and consumption scales motivated the global economies to opt for the race to the bottom approach, leading to environmental unsustainability. On the one hand, economies focused on escalated production levels proliferating non-renewable energy consumption and reducing energy productivity, leading to production-based carbon dioxide (CO<sub>2</sub>) emissions. On the other hand, international trade of high CO<sub>2</sub> emissions-embedded goods has skyrocketed the consumption-based CO<sub>2</sub> emissions. Since production and consumption-based CO<sub>2</sub> emissions challenge environmental sustainability, there is an urgent need to pursue sustainable production and consumption to realize the United Nations' Sustainable Development Goals (SDGs) dream. In this regard, eco-innovation came into play to transition the conventional production setup to a cleaner production mode. Eco-innovation involves all types of technological advancements extending contributions to the SDGs. In this regard, climate technologies and environmental technologies involving renewable energy (e.g., wind, solar, biogas), energy-efficient technologies (e.g., energy-efficient electric appliances), environmental pollution reduction technologies (e.g., carbon-scrubbing filters, water purifiers, waste mitigation technologies) play a tremendous role in mitigating climatic adversities and environmental unsustainabilities. By contributing to the responsible use of natural capital, eco-innovation facilitates efficient energy utilization improving energy productivity as well as environmental sustainability. Moreover, eco-innovation has the inherent potential to aggravate sustainable production modes through green productivity, a tool to enhance industrial outputs with fewer harms to the environment. As a progressive move, green productivity growth promotes a new trend of producing more

economic output by consuming fewer resources and safeguarding ecosystems. The mainstream empirical literature substantiated that eco-innovation and green productivity remained critical players in limiting CO2 emissions and promoting environmental sustainability. Literature also witnessed that eco-innovation ameliorated energy productivity by motivating the countries to adopt cost-saving and environmentally-friendly technologies. On the contrary, the rebound effect supported the environmental deterioration impact of such technologies. Against this backdrop, this Research Topic will provide an opportunity to further delve into the influencing mechanisms triggered by eco-innovation and green productivity growth on energy productivity and environmental sustainability for a futuristic perspective of “sustainable production and consumption.” This Research Topic welcomes theoretical and empirical original research articles and reviews. Research themes and areas include (but are not limited to) the following: · Links between eco-innovation, green productivity growth, and energy productivity for sustainable production · Climate technologies and carbon neutrality applications for sustainable production · Firm-level environment-related innovation practices · Renewable and energy-efficient industrial transition for sustainable production · Eco-innovation through the firm life cycle for sustainable production and consumption · Green innovation-driven business models for sustainable production · Climate technology-driven policies for sustainable production and consumption · Eco-innovation and zero-emissions agenda implementation
