CO2 Conversion by Reverse Water Gas Shift Reaction Abdulaziz Alamer, 2018 In recent decades, the world has been concerned about the environmental impact of CO2 emissions into the atmosphere. Thus, researchers have been focusing on enhancing current technologies, such as the Reverse Water Gas Shift (RWGS) reaction, to convert CO2 to synthetic fuels. The goal of this research was to develop a catalyst that has a high CO2 conversion and CO selectivity. To achieve this goal, different experiments were conducted at the same conditions to study the effect of different supports, metal loadings and different metals. All the experimental results were compared to equilibrium data obtained from Aspen Plus. Each tested catalyst was analyzed by BET and XRD to understand its physical and chemical structure as well as its behavior. Best catalyst was identified to be 5 wt% Cu supported on MgO, which achieved 20% CO2 conversion, 84% of Equilibrium CO2 conversion, and 75% CO selectivity.

Chemical Fixation of Carbon DioxideMethods for Recycling CO2 into Useful Products Martin M.

Halmann,1993-06-09 Chemical Fixation of Carbon Dioxide presents new concepts and results from research into the problems caused by increasing levels of carbon dioxide. The book discusses the limitations of natural plant photosynthesis as a sink for carbon dioxide and emphasizes chemical fixation as an important alternative. A number of significant topics are covered, including new coupling reactions for producing compounds such as carbamates, urethanes, and heterocyclic structures; new catalyst systems, particularly for methanation and methanol synthesis; the use of homogeneous solution photosensitizers and heterogeneous semiconductor photocatalysts to photoreduce carbon dioxide with visible light and sunlight; and electrochemical reduction. This book will be a useful reference for organic chemists working on environmental problems, chemical engineers, environmental chemists, professionals at research facilities, and students.

Fundamentals Michael North,Peter Styring,2019-10-21 The conversion of CO2 to chemicals and consumables is a pioneering approach to utilize undesired CO2 emissions and simultaneously create new products out of sustainable feedstock. Volume 1 gives an introduction to CO2 chemistry, utilisation and sustainability and further discusses its capture and separation. Both volumes are also included in a set ISBN 978-3-11-066549-9.

Iron and Cobalt Catalysts Wilson D. Shafer, Gary Jacobs, 2020-06-23 Since the turn of the last century when the field of catalysis was born, iron and cobalt have been key players in numerous catalysis processes. These metals, due to their ability to activate CO and CH, have a major economic impact worldwide. Several industrial processes and synthetic routes use these metals: biomass-to-liquids (BTL), coal-to-liquids (CTL), natural gas-to-liquids (GTL), water-gas-shift, alcohol synthesis, alcohol steam reforming, polymerization processes, cross-coupling reactions, and photocatalyst activated reactions. A vast number of materials are produced from these processes, including oil, lubricants, waxes, diesel and jet fuels, hydrogen (e.g., fuel cell applications), gasoline, rubbers, plastics, alcohols, pharmaceuticals, agrochemicals, feed-stock chemicals, and other alternative materials. However, given the true complexities of the variables involved in these processes, many key mechanistic issues are still not fully defined or understood. This Special Issue of Catalysis will be a collaborative effort to combine current catalysis research on these metals from experimental and theoretical perspectives on both heterogeneous and homogeneous catalysts. We welcome contributions from the catalysis community on catalyst characterization, kinetics, reaction mechanism, reactor development, theoretical modeling, and surface science.

Advances and Technology Development in Greenhouse Gases: Emission, Capture and Conversion. Mohammad Reza

Rahimpour, Mohammad Amin Makarem, Maryam Meshksar, 2024-07-11 Advances and Technology Development in Greenhouse Gases: Emission, Capture and Conversion is a comprehensive seven-volume set of books that discusses the composition and properties of greenhouse gases, and introduces different sources of greenhouse gases emission and the relation between greenhouse gases and global warming. The comprehensive and detailed presentation of common technologies as well as novel research related to all aspects of greenhouse gases makes this work an indispensable encyclopedic resource for researchers in academia and industry. Volume 5 titled Carbon Dioxide Conversion to Chemicals and Energy provides a beneficial strategy to control the rise of greenhouse gases (GHGs) in the atmosphere and their conversion into valuable materials such as chemical and energy carriers. The book touches concepts about the conversion of carbon dioxide, which is the main GHG. This two-section volume provides applications of carbon dioxide and the chemical processes employed to fabricate a host of materials. Each section reviews a process in detail and surveys the economic assessments, cost analysis, environmental impacts and challenges, recent advances and new concepts, and the largest operating plants and pilots for carbon conversion. - Introduces different applications of carbon dioxide - Includes environmental challenges and economic assessment of carbon capture and utilization - Describes various chemicals produced from CO2

An Economy Based on Carbon Dioxide and Water Michele Aresta, Iftekhar Karimi, Sibudjing Kawi, 2019-07-01 This book is devoted to CO2 capture and utilization (CCU) from a green, biotechnological and economic perspective, and presents the potential of, and the bottlenecks and breakthroughs in converting a stable molecule such as CO2 into specialty chemicals and materials or energy-rich compounds. The use of renewable energy (solar, wind, geothermal, hydro) and non-fossil hydrogen is a must for converting large volumes of CO2 into energy products, and as such, the authors explore and compare the availability of hydrogen from water using these sources with that using oil or methane. Divided into 13 chapters, the book offers an analysis of the conditions under which CO2 utilization is possible, and discusses CO2 capture from concentrated sources and the atmosphere. It also analyzes the technological (non-chemical) uses of CO2, carbonation of basic minerals and industrial sludge, and the microbial-catalytic-electrochemical-photoelectrochemical-plasma conversion of CO2 into chemicals and energy products. Further, the book provides examples of advanced bioelectrochemical syntheses and RuBisCO engineering, as well as a techno-energetic and economic analysis of CCU. Written by leading international experts, this book offers a unique perspective on the potential of the various technologies discussed, and a vision for a sustainable future. Intended for graduates with a good understanding of chemistry, catalysis, biotechnology, electrochemistry and photochemistry, it particularly appeals to researchers (in academia and industry) and university teachers.
