How Children Learn from Parents and Parenting Others in Formal and Informal Settings: International and Cultural Perspectives, 2nd Edition Yvette Renee Harris, Claudio Longobardi, 2020-07-28 For several decades, parent-child cognitive interaction researchers have acknowledged that children learn cognitive skills in the context of their social and early environments. These cognitive skills are often imparted to the children by parents or parenting others in formal or informal settings. Thus, for example, such informal settings as dinner table conversations, walks through grocery stores, museums, or neighborhoods become rich laboratories for children to learn varied cognitive skills ranging from numeracy, concepts, and language. The way in which those learning opportunities are provided by parents, structured by parents and scaffolded by parents may well vary depending on culture, and other socio-demographic variables; and may well vary depending on formal or informal settings. The aim of this Research Topic is to bring together scholarship from both global north and global south contexts which explores how children learn via parental involvement in formal and informal settings. Publisher's note: In this 2nd edition, the following article has been added: Harris YR and Longobardi C (2020) Editorial: How Children Learn From Parents and Parenting Others in Formal and Informal Settings: International and Cultural Perspectives. *Front. Family Resemblances Among American Men of Science Dean R. Brimhall, 1923

Aging, Reproduction, and the Climacteric Luigi Mastroianni Jr., C. Alvin Paulsen, 2012-12-06 Interest in sexuality and reproductive function does not cease when people begin to age. Instead, a new set of questions arises. Women want to know if it is safe to have babies in their late thirties and early forties. They want to know more about hot flashes and other symptoms of menopause-which ones are dangerous and which are merely uncomfortable. They are eager to learn about the relative risks and benefits of estrogen replacement therapy. Men, too, are concerned about age-related changes in their sexual function. Experts in reproductive physiology, gerontology, and genetics met at the National Institutes of Health in June of 1984 to discuss these and other concerns about aging and the reproductive system. The conference on Aging, Reproduction, and the Climacteric was sponsored by the American Fertility Society, The National Institute on Aging, and the

National Institute of Child Health and Human Development. This volume is based on the proceedings of that conference.

Biometrical Genetics Kenneth Mather, John L. Jinks, 2013-11-11 The properties of continuous variation are basic to the theory of evolution and to the practice of plant and animal improvement. Yet the genetical study of continuous variation has lagged far behind that of discontinuous variation. The reason for this situation is basically methodological. Mendel gave us not merely his principles of heredity, but also a method of experiment by which these principles could be tested over a wider range of living species, and extended into the elaborate genetical theory of today. The power of this tool is well attested by the speed with which genetics has grown. In less than fifty years, it has not only developed a theoretical structure which is unique in the biological sciences, but has established a union with nuclear cytology so close that the two have become virtually a single science offering us a new approach to problems so diverse as those of evolution, development, disease, cellular chemistry and human welfare. Much of this progress would have been impossible and all would have been slower without the Mendelian method of recognizing and using unit differences in the genetic materials. These great achievements should not, however, blind us to the limitations inherent in the method itself. It depends for its success on the ability to assign the individuals to classes whose clear phenotypic distinctions reveal the underlying genetic differences.

Mathematical Demography D. Smith, Nathan Keyfitz, 2012-12-06 This volume is an effort to bring together important contributions to the mathematical development of demography and to suggest briefly their historical context. We have tried to find who first thought of the several concepts and devices commonly used by demographers, what sort of problem he was facing to which the device or concept seemed the solution, and how his invention developed subsequently in the hands of others. Historically, the book starts with a Roman table of life expectancies from the third century a. d. about which we know little, and with John Graunt's explorations in an area that was still popularly suspect when he wrote in 1662. These are followed by the astronomer Halley, who looked into the field long enough to invent the life table and to notice that Their Majesties would take a sizeable loss on the annuity scheme they had just launched; and by Euler, who was first to devise the formulas of stable population theory and to apply them to filling gaps in data. To these we add the handful of further contributions in the 19th century and many pieces from the explosion of contributions that began in this century with Lotka. We doubt that we have managed to trace everything back to its ultimate beginning, and suspect that our nominees in some cases have been anticipated by predecessors who will be turned up by other students.
