Microbiome Associated With Plant Pathogens, Pathogenesis, and Their Applications in Developing Sustainable Agriculture Baoyu Tian,Jian-Wei Guo,Xiao Lin Wang,Dilfuza Egamberdieva,Osama Abdalla Abdelshafy Mohamad,2024-05-28 Plant pathogens, such as fungi, bacteria, viruses, nematodes, insect pests, etc., can pose a great threat to plants in agricultural and natural ecosystems worldwide. The plant disease triangle illustrates that pathogenesis in the plant is not only the outcome of the interactions between the plant host and pathogens but also the consequence of their

interactions with the microbiomes associated with plant hosts and pathogens. Both microbiomes associated with plant host and pathogen regulate plant health and pathogen infection. Microbes can play an important role in promoting plant growth, and protecting from pathogens and/or insects. A healthy plant microbiome is crucial for plant survival, production, nutrient acquisition, abiotic or biotic stress tolerance, etc. However, the microbiome does not always cooperatively interact with plant hosts to promote host health. They may also deter plant health or promote pathogenicity by the production of toxins, suppressing plant innate immunity, or building a symbiotic or mutual relationship with pathogens or insect pests to facilitate the occurrence of plant disease. In addition, the disease can result in a plant if a susceptible host plant is in intimate association with a virulent pathogen under favorable or altered abiotic or biotic environmental conditions. For example, growing evidence suggests disease occurrence in plants is often accompanied by changes in the associated microbial community structure, composition, and even function.
