Intervals, Scales, Tones and the Concert Pitch C Maria Renold, 2015 Why is it that certain intervals, scales, and tones sound genuine, while others sound false? Is the modern person able to experience a qualitative difference in a tone's pitch? If so, what are the implications for modern concert pitch and how instruments of fixed tuning are tuned? Renold tackles these and many other questions and provides a wealth of scientific data. Her pioneering work is the result of a lifetime of research into the Classical Greek origin of Western music and the search for modern developments. She deepens our musical understanding by using Rudolf Steiner's spiritual science as a basis, and she elucidates many of his puzzling statements about music. The results of her work include the following discoveries: - The octave has two sizes (a 'genuine' sounding octave is bigger than the perfect octave) - There are three sizes of perfect fifths - An underlying form principle for all scales can be found - Equal temperament is not the most satisfactory method of tuning a piano - She provides a basis for some of Steiner's statements, such as, C is always prime and $C = 128 \text{ Hz} = \text{Sun}$. Intervals, Scales, Tones is a valuable resource for those who wish to understand the deeper, spiritual aspects of music.

Harmony Heinrich Schenker, 1954 Harmony, Heinrich Schenker's first published work, originally appeared in German in 1906 as *New Musical Theories and Phantasies*, by an Artist. Its unusual title indicates what was to be the rationale of Schenker's lifework, that artistic problems call for artistic solutions. Schenker's dedication to the formulation of a complete musical theory above the commonplace theoretical discussions was, in essence, his quest for a pattern in nature for music as art. Schenker's theory draws upon a profound understanding of the works of the masters and every proposition is illustrated by a living musical example.
