Analysing Cloud DDoS Attacks Using Supervised Machine Learning Chisom Elizabeth Alozie,2025-02-02 Cloud computing in its simplest form refers to the provision of hardware and software to deliver a service over an internet network. However, Cloud Computing has numerous issues, such as security attacks and distributed denial of service (DDoS). A DDoS attack is defined as a method of attack in which numerous computer systems are allowed to attack a target, such as a server, any resource, or website, resulting in a denial of service for the resource's intended users. This research analysed the normal traffic and DDoS attack traffic from cloud environments using machine learning technology to detect DDoS attacks. This work’s main contribution is the extraction of dataset features and the discovery of new flow features for DDoS attack detection. To create the dataset, novel features are stored in a CSV file using the CICFlowMeter tool. Features were selected using a correlation coefficient to get better model accuracy. Machine learning algorithms were trained on the resulting cloud dataset. The existing work reviews for detection of DDoS attacks either used a cloud dataset or another network data set, or the research findings were kept confidential. The methodology used to solve this problem is the CRISP-DM methodology. The proposed solution deployed a brand-new dataset with five machine-learning models for classification. The findings of this study help to improve knowledge of the ability of DDoS datasets to detect intrusions. Five performance metrics—accuracy, precision, recall, F1-score, and computation time were used to analyse the datasets. Based on the results achieved with the new dataset, the Random Forest, Support Vector Machine, Decision Tree, and K-NN achieved a 100% rate of 100% on the accuracy, precision, recall, and F1 score in a shorter computation time. With the open-source dataset, Random Forest, Decision Tree, and K-Nearest Neighbor achieved 100% accuracy.

Hacking Alex Wagner,2019-12-17 In order to understand hackers and protect the network infrastructure you must think like a hacker in today's expansive and eclectic internet and you must understand that nothing is fully secured.This book will focus on some of the most dangerous hacker tools that are favourite of both, White Hat and Black Hat hackers.If you attempt to use any of the tools discussed in this book on a network without being authorized and you disturb or damage any systems, that would be considered illegal black hat hacking. So, I would like to encourage all readers to deploy any tool described in this book for WHITE HAT USE ONLY.The focus of this book will be to introduce some of the best well known software that you can use for free of charge, furthermore where to find them, how to access them, and finally in every chapter you will find demonstrated examples step-by-step.Additionally you will be demonstrated how to create a Denial of Service Attack, how to manipulate the network infrastructure by creating fake packets, as well how to replicate any networking device, and fool end users to install backdoors on demand.There are many step by step deployment guides on how to plan a successful penetration test and examples on how to manipulate or misdirect trusted employees using social engineering.Your reading of
